Get the subnet ID for an instance

This example gets the subnet ID for an instance.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -  
Uri http://169.254.169.254/latest/meta-data/network/interfaces/macs/02:29:96:8f:6a:2d/  
subnet-id  
subnet-be9b61d7
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/network/interfaces/macs/02:29:96:8f:6a:2d/subnet-id
```

subnet-be9b61d7

Get the instance tags for an instance

In the following examples, the sample instance has [tags on instance metadata enabled \(p. 2097\)](#) and the instance tags Name=MyInstance and Environment=Dev.

This example gets all the instance tag keys for an instance.

IMDSv2

```
PS C:\> $token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token

PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/tags/instance
Name
Environment
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/tags/instance
Name
Environment
```

The following example gets the value of the Name key that was obtained in the preceding example. The IMDSv2 request uses the stored token that was created in the preceding example command, assuming it has not expired.

IMDSv2

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/tags/instance/Name
MyInstance
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/tags/instance/
Name
MyInstance
```

Query throttling

We throttle queries to the IMDS on a per-instance basis, and we place limits on the number of simultaneous connections from an instance to the IMDS.

If you're using the IMDS to retrieve AWS security credentials, avoid querying for credentials during every transaction or concurrently from a high number of threads or processes, as this might lead to throttling. Instead, we recommend that you cache the credentials until they start approaching their expiry time. For more information about IAM role and security credentials associated with the role, see [Retrieve security credentials from instance metadata \(p. 1650\)](#).

If you are throttled while accessing the IMDS, retry your query with an exponential backoff strategy.

Limit IMDS access

You can consider using local firewall rules to disable access from some or all processes to the IMDS.

Note

For [Instances built on the Nitro System \(p. 218\)](#), IMDS can be reached from your own network when a network appliance within your VPC, such as a virtual router, forwards packets to the IMDS address, and the default [source/destination check](#) on the instance is disabled. To prevent a source from outside your VPC reaching IMDS, we recommend that you modify the configuration of the network appliance to drop packets with the destination IPv4 address of IMDS 169.254.169.254 and, if you enabled the IPv6 endpoint, the IPv6 address of IMDS fd00:ec2::254.

Using Windows firewall to limit access

The following PowerShell example uses the built-in Windows firewall to prevent the Internet Information Server webserver (based on its default installation user ID of NT AUTHORITY\IUSR) from accessing 169.254.169.254. It uses a *deny rule* to reject all instance metadata requests (whether IMDSv1 or IMDSv2) from any process running as that user.

```
PS C:\> $blockPrincipal = New-Object -TypeName System.Security.Principal.NTAccount ("NT AUTHORITY\IUSR")
PS C:\> $BlockPrincipalSID =
$blockPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $BlockPrincipalSDDL = "D:(A;;CC;;;$BlockPrincipalSID)"
PS C:\> New-NetFirewallRule -DisplayName "Block metadata service from IIS" -Action block -
Direction out `
-Protocol TCP -RemoteAddress 169.254.169.254 -LocalUser $BlockPrincipalSDDL
```

Or, you can consider only allowing access to particular users or groups, by using *allow rules*. Allow rules might be easier to manage from a security perspective, because they require you to make a decision about what software needs access to instance metadata. If you use *allow rules*, it's less likely you will accidentally allow software to access the metadata service (that you did not intend to have access) if you later change the software or configuration on an instance. You can also combine group usage with allow rules, so that you can add and remove users from a permitted group without needing to change the firewall rule.

The following example prevents access to instance metadata by all processes running as an OS group specified in the variable `blockPrincipal` (in this example, the Windows group Everyone), except for processes specified in `exceptionPrincipal` (in this example, a group called `trustworthy-users`). You must specify both deny and allow principals because Windows Firewall, unlike the `! --uid-owner trustworthy-user` rule in Linux iptables, does not provide a shortcut mechanism to allow only a particular principal (user or group) by denying all the others.

```
PS C:\> $blockPrincipal = New-Object -TypeName System.Security.Principal.NTAccount
("Everyone")
PS C:\> $BlockPrincipalSID =
$blockPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $exceptionPrincipal = New-Object -TypeName System.Security.Principal.NTAccount
("trustworthy-users")
PS C:\> $ExceptionPrincipalSID =
$exceptionPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $PrincipalSDDL = "O:LSD:(D;;CC;;;$ExceptionPrincipalSID)(A;;CC;;
$BlockPrincipalSID)"
PS C:\> New-NetFirewallRule -DisplayName "Block metadata service for
($blockPrincipal.Value), exception: $($exceptionPrincipal.Value)" -Action block -
Direction out `
-Protocol TCP -RemoteAddress 169.254.169.254 -LocalUser $PrincipalSDDL
```

Note

To use local firewall rules, you need to adapt the preceding example commands to suit your needs.

Using netsh rules to limit access

You can consider blocking all software using netsh rules, but those are much less flexible.

```
C:\> netsh advfirewall firewall add rule name="Block metadata service altogether" dir=out  
protocol=TCP remoteip=169.254.169.254 action=block
```

Note

- To use local firewall rules, you need to adapt the preceding example commands to suit your needs.
- netsh rules must be set from an elevated command prompt, and can't be set to deny or allow particular principals.

Work with instance user data

When working with instance user data, keep the following in mind:

- User data must be base64-encoded. The Amazon EC2 console can perform the base64-encoding for you or accept base64-encoded input.
- User data is limited to 16 KB, in raw form, before it is base64-encoded. The size of a string of length n after base64-encoding is $\text{ceil}(n/3)*4$.
- User data must be base64-decoded when you retrieve it. If you retrieve the data using instance metadata or the console, it's decoded for you automatically.
- User data is treated as opaque data: what you give is what you get back. It is up to the instance to be able to interpret it.
- If you stop an instance, modify its user data, and start the instance, the updated user data is not run automatically when you start the instance. However, you can configure settings so that updated user data scripts are run one time when you start the instance or every time you reboot or start the instance.

Specify instance user data at launch

You can specify user data when you launch an instance. You can specify that the user data is run one time at launch, or every time you reboot or start the instance. For more information, see [Run commands on your Windows instance at launch \(p. 853\)](#).

Modify instance user data

You can modify user data for an instance in the stopped state if the root volume is an EBS volume. For more information, see [View and update the instance user data \(p. 859\)](#).

Retrieve instance user data

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: fd00:ec2::254. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [Instances built on the Nitro System \(p. 218\)](#).

To retrieve user data from within a running instance, use the following URI.

```
http://169.254.169.254/latest/user-data
```

A request for user data returns the data as it is (content type application/octet-stream).

This example returns user data that was provided as comma-separated text.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/user-data  
1234,john,reboot,true | 4512,richard, | 173,,,
```

IMDSv1

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token} -Method GET -uri http://169.254.169.254/latest/user-data  
1234,john,reboot,true | 4512,richard, | 173,,,
```

This example returns user data that was provided as a script.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/user-data  
<powershell>  
$file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")  
New-Item $file -ItemType file  
</powershell>  
<persist>true</persist>
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/user-data  
<powershell>  
$file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")  
New-Item $file -ItemType file  
</powershell>  
<persist>true</persist>
```

To retrieve user data for an instance from your own computer, see [User data and the Tools for Windows PowerShell \(p. 860\)](#).

Retrieve dynamic data

To retrieve dynamic data from within a running instance, use the following URI.

```
http://169.254.169.254/latest/dynamic/
```

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: fd00:ec2::254. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [Instances built on the Nitro System \(p. 218\)](#).

This example shows how to retrieve the high-level instance identity categories.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/dynamic/instance-identity/
document
rsa2048
pkcs7
signature
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/dynamic/instance-identity/
document
rsa2048
pkcs7
signature
```

For more information about dynamic data and examples of how to retrieve it, see [Instance identity documents \(p. 896\)](#).

Instance metadata categories

Instance metadata is divided into categories. To retrieve instance metadata, you specify the category in the request, and the metadata is returned in the response.

When new categories are released, a new instance metadata build is created with a new version number. In the following table, the **Version when category was released** column specifies the build version when an instance metadata category was released. To avoid having to update your code every time Amazon EC2 releases a new instance metadata build, use latest instead of the version number in your metadata requests. For more information, see [Get the available versions of the instance metadata \(p. 878\)](#).

When Amazon EC2 releases a new instance metadata category, the instance metadata for the new category might not be available for existing instances. With instances built on the [Nitro system \(p. 218\)](#), you can retrieve instance metadata only for the categories that were available at launch. For instances with the Xen hypervisor, you can [stop and then start \(p. 594\)](#) the instance to update the categories that are available for the instance.

The following table lists the categories of instance metadata. Some of the category names include placeholders for data that is unique to your instance. For example, *mac* represents the MAC address for the network interface. You must replace the placeholders with actual values when you retrieve the instance metadata.

Category	Description	Version when category was released
ami-id	The AMI ID used to launch the instance.	1.0
ami-launch-index	If you started more than one instance at the same time, this value indicates the order in which the instance was launched. The value of the first instance launched is 0.	1.0
ami-manifest-path	The path to the AMI manifest file in Amazon S3. If you used an Amazon EBS-backed AMI to launch the instance, the returned result is unknown.	1.0
ancestor-ami-ids	The AMI IDs of any instances that were rebundled to create this AMI. This value will only exist if the AMI manifest file contained an <code>ancestor-amis</code> key.	2007-10-10
autoscaling/target-lifecycle-state	Value showing the target Auto Scaling lifecycle state that an Auto Scaling instance is transitioning to. Present when the instance transitions to one of the target lifecycle states after March 10, 2022. Possible values: Detached InService Standby Terminated Warmed:Hibernated Warmed:Running Warmed:Stopped Warmed:Terminated. See Retrieve the target lifecycle state through instance metadata in the <i>Amazon EC2 Auto Scaling User Guide</i> .	2021-07-15
block-device-mapping/ami	The virtual device that contains the root/boot file system.	2007-12-15
block-device-mapping/ebs <i>N</i>	The virtual devices associated with any Amazon EBS volumes. Amazon EBS volumes are only available in metadata if they were present at launch time or when the instance was last started. The <i>N</i> indicates the index of the Amazon EBS volume (such as ebs1 or ebs2).	2007-12-15
block-device-mapping/ephemeral <i>N</i>	The virtual devices for any non-NVMe instance store volumes. The <i>N</i> indicates the index of each volume. The number of instance store volumes in the block device mapping might not match the actual	2007-12-15

Category	Description	Version when category was released
	number of instance store volumes for the instance. The instance type determines the number of instance store volumes that are available to an instance. If the number of instance store volumes in a block device mapping exceeds the number available to an instance, the additional instance store volumes are ignored.	
block-device-mapping/root	The virtual devices or partitions associated with the root devices or partitions on the virtual device, where the root (/ or C:) file system is associated with the given instance.	2007-12-15
block-device-mapping/swap	The virtual devices associated with swap. Not always present.	2007-12-15
elastic-gpus/associations/ <i>elastic-gpu-id</i>	If there is an Elastic GPU attached to the instance, contains a JSON string with information about the Elastic GPU, including its ID and connection information.	2016-11-30
elastic-inference/associations/ <i>eia-id</i>	If there is an Elastic Inference accelerator attached to the instance, contains a JSON string with information about the Elastic Inference accelerator, including its ID and type.	2018-11-29
events/maintenance/history	If there are completed or canceled maintenance events for the instance, contains a JSON string with information about the events. For more information, see To view event history about completed or canceled events (p. 1164) .	2018-08-17
events/maintenance/scheduled	If there are active maintenance events for the instance, contains a JSON string with information about the events. For more information, see View scheduled events (p. 1161) .	2018-08-17

Category	Description	Version when category was released
events/recommendations/rebalance	<p>The approximate time, in UTC, when the EC2 instance rebalance recommendation notification is emitted for the instance. The following is an example of the metadata for this category: {"noticeTime": "2020-11-05T08:22:00Z"}. This category is available only after the notification is emitted. For more information, see EC2 instance rebalance recommendations (p. 429).</p>	2020-10-27
hostname	<p>If the EC2 instance is using IP-based naming (IPBN), this is the private IPv4 DNS hostname of the instance. If the EC2 instance is using Resource-based naming (RBN), this is the RBN. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). For more information about IPBN and RBN, see Amazon EC2 instance hostname types (p. 1250).</p>	1.0
iam/info	<p>If there is an IAM role associated with the instance, contains information about the last time the instance profile was updated, including the instance's LastUpdated date, InstanceProfileArn, and InstanceProfileId. Otherwise, not present.</p>	2012-01-12
iam/security-credentials/role-name	<p>If there is an IAM role associated with the instance, <i>role-name</i> is the name of the role, and <i>role-name</i> contains the temporary security credentials associated with the role (for more information, see Retrieve security credentials from instance metadata (p. 1650)). Otherwise, not present.</p>	2012-01-12
identity-credentials/ec2/info	<p>Information about the credentials in identity-credentials/ec2/security-credentials/ec2-instance.</p>	2018-05-23

Category	Description	Version when category was released
<code>identity-credentials/ec2/security-credentials/ec2-instance</code>	<p>Credentials for the instance identity role that allow on-instance software to identify itself to AWS to support features such as EC2 Instance Connect and AWS Systems Manager Default Host Management Configuration. These credentials have no policies attached, so they have no additional AWS API permissions beyond identifying the instance to the AWS feature.</p> <p>For more information, see Instance identity roles (p. 925).</p>	2018-05-23
<code>instance-action</code>	<p>Notifies the instance that it should reboot in preparation for bundling. Valid values: none shutdown bundle-pending.</p>	2008-09-01
<code>instance-id</code>	The ID of this instance.	1.0
<code>instance-life-cycle</code>	<p>The purchasing option of this instance. For more information, see Instance purchasing options (p. 349).</p>	2019-10-01
<code>instance-type</code>	<p>The type of instance. For more information, see Instance types (p. 210).</p>	2007-08-29
<code>ipv6</code>	<p>The IPv6 address of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0) network interface and the first IPv6 address assigned. If no IPv6 address exists on network interface[0], this item is not set and results in an HTTP 404 response.</p>	2021-01-03
<code>kernel-id</code>	The ID of the kernel launched with this instance, if applicable.	2008-02-01

Category	Description	Version when category was released
local-hostname	In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If the EC2 instance is using IP-based naming (IPBN), this is the private IPv4 DNS hostname of the instance. If the EC2 instance is using Resource-based naming (RBN), this is the RBN. For more information about IPBN, RBN, and EC2 instance naming, see Amazon EC2 instance hostname types (p. 1250) .	2007-01-19
local-ipv4	The private IPv4 address of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If this is an IPv6-only instance, this item is not set and results in an HTTP 404 response.	1.0
mac	The instance's media access control (MAC) address. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0).	2011-01-01
metrics/vhostmd	No longer available.	2011-05-01
network/interfaces/macs/mac/device-number	The unique device number associated with that interface. The device number corresponds to the device name; for example, a device-number of 2 is for the eth2 device. This category corresponds to the DeviceIndex and device-index fields that are used by the Amazon EC2 API and the EC2 commands for the AWS CLI.	2011-01-01
network/interfaces/macs/mac/interface-id	The ID of the network interface.	2011-01-01
network/interfaces/macs/mac/ipv4-associations/public-ip	The private IPv4 addresses that are associated with each public IP address and assigned to that interface.	2011-01-01
network/interfaces/macs/mac/ipv6s	The IPv6 addresses associated with the interface. Returned only for instances launched into a VPC.	2016-06-30

Category	Description	Version when category was released
network/interfaces/macs/mac/local-hostname	The private IPv4 DNS hostname of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If this is a IPv6-only instance, this is the resource-based name. For more information about IPBN and RBN, see Amazon EC2 instance hostname types (p. 1250) .	2007-01-19
network/interfaces/macs/mac/local-ipv4s	The private IPv4 addresses associated with the interface. If this is an IPv6-only network interface, this item is not set and results in an HTTP 404 response.	2011-01-01
network/interfaces/macs/mac/mac	The instance's MAC address.	2011-01-01
network/interfaces/macs/ <i>mac</i> /network-card-index	The index of the network card. Some instance types support multiple network cards.	2020-11-01
network/interfaces/macs/mac/owner-id	The ID of the owner of the network interface. In multiple-interface environments, an interface can be attached by a third party, such as Elastic Load Balancing. Traffic on an interface is always billed to the interface owner.	2011-01-01
network/interfaces/macs/mac/public-hostname	The interface's public DNS (IPv4). This category is only returned if the enableDnsHostnames attribute is set to true. For more information, see DNS attributes for your VPC in the <i>Amazon VPC User Guide</i> . If the instance only has a public-IPv6 address and no public-IPv4 address, this item is not set and results in an HTTP 404 response.	2011-01-01
network/interfaces/macs/mac/public-ipv4s	The public IP address or Elastic IP addresses associated with the interface. There may be multiple IPv4 addresses on an instance.	2011-01-01
network/interfaces/macs/mac/security-groups	Security groups to which the network interface belongs.	2011-01-01
network/interfaces/macs/mac/security-group-ids	The IDs of the security groups to which the network interface belongs.	2011-01-01

Category	Description	Version when category was released
network/interfaces/macs/mac/subnet-id	The ID of the subnet in which the interface resides.	2011-01-01
network/interfaces/macs/mac/subnet-ipv4-cidr-block	The IPv4 CIDR block of the subnet in which the interface resides.	2011-01-01
network/interfaces/macs/mac/subnet-ipv6-cidr-blocks	The IPv6 CIDR block of the subnet in which the interface resides.	2016-06-30
network/interfaces/macs/mac/vpc-id	The ID of the VPC in which the interface resides.	2011-01-01
network/interfaces/macs/mac/vpc-ipv4-cidr-block	The primary IPv4 CIDR block of the VPC.	2011-01-01
network/interfaces/macs/mac/vpc-ipv4-cidr-blocks	The IPv4 CIDR blocks for the VPC.	2016-06-30
network/interfaces/macs/mac/vpc-ipv6-cidr-blocks	The IPv6 CIDR block of the VPC in which the interface resides.	2016-06-30
placement/availability-zone	The Availability Zone in which the instance launched.	2008-02-01
placement/availability-zone-id	The static Availability Zone ID in which the instance is launched. The Availability Zone ID is consistent across accounts. However, it might be different from the Availability Zone, which can vary by account.	2019-10-01
placement/group-name	The name of the placement group in which the instance is launched.	2020-08-24
placement/host-id	The ID of the host on which the instance is launched. Applicable only to Dedicated Hosts.	2020-08-24
placement/partition-number	The number of the partition in which the instance is launched.	2020-08-24
placement/region	The AWS Region in which the instance is launched.	2020-08-24
product-codes	AWS Marketplace product codes associated with the instance, if any.	2007-03-01

Category	Description	Version when category was released
public-hostname	The instance's public DNS (IPv4). This category is only returned if the enableDnsHostnames attribute is set to true. For more information, see DNS attributes for your VPC in the <i>Amazon VPC User Guide</i> . If the instance only has a public-IPv6 address and no public-IPv4 address, this item is not set and results in an HTTP 404 response.	2007-01-19
public-ipv4	The public IPv4 address. If an Elastic IP address is associated with the instance, the value returned is the Elastic IP address.	2007-01-19
public-keys/0/openssh-key	Public key. Only available if supplied at instance launch time.	1.0
ramdisk-id	The ID of the RAM disk specified at launch time, if applicable.	2007-10-10
reservation-id	The ID of the reservation.	1.0
security-groups	The names of the security groups applied to the instance. After launch, you can change the security groups of the instances. Such changes are reflected here and in network/interfaces/mac/ <i>mac</i> /security-groups.	1.0
services/domain	The domain for AWS resources for the Region.	2014-02-25
services/partition	The partition that the resource is in. For standard AWS Regions, the partition is aws. If you have resources in other partitions, the partition is aws- <i>partitionname</i> . For example, the partition for resources in the China (Beijing) Region is aws-cn.	2015-10-20
spot/instance-action	The action (hibernate, stop, or terminate) and the approximate time, in UTC, when the action will occur. This item is present only if the Spot Instance has been marked for hibernate, stop, or terminate. For more information, see instance-action (p. 441) .	2016-11-15

Category	Description	Version when category was released
spot/termination-time	The approximate time, in UTC, that the operating system for your Spot Instance will receive the shutdown signal. This item is present and contains a time value (for example, 2015-01-05T18:02:00Z) only if the Spot Instance has been marked for termination by Amazon EC2. The termination-time item is not set to a time if you terminated the Spot Instance yourself. For more information, see termination-time (p. 441) .	2014-11-05
tags/instance	The instance tags associated with the instance. Only available if you explicitly allow access to tags in instance metadata. For more information, see Allow access to tags in instance metadata (p. 2097) .	2021-03-23

Dynamic data categories

The following table lists the categories of dynamic data.

Category	Description	Version when category was released
fws/instance-monitoring	Value showing whether the customer has enabled detailed one-minute monitoring in CloudWatch. Valid values: enabled disabled	2009-04-04
instance-identity/document	JSON containing instance attributes, such as instance-id, private IP address, etc. See Instance identity documents (p. 896) .	2009-04-04
instance-identity/pkcs7	Used to verify the document's authenticity and content against the signature. See Instance identity documents (p. 896) .	2009-04-04
instance-identity/signature	Data that can be used by other parties to verify its origin and authenticity. See Instance identity documents (p. 896) .	2009-04-04

Instance identity documents

Each instance that you launch has an instance identity document that provides information about the instance itself. You can use the instance identity document to validate the attributes of the instance.

The instance identity document is generated when the instance is stopped and started, restarted, or launched. The instance identity document is exposed (in plaintext JSON format) through the Instance Metadata Service (IMDS). The IPv4 address 169.254.169.254 is a link-local address and is valid only from the instance. For more information, see [Link-local address](#) on Wikipedia. The IPv6 address fd00:ec2::254 is a unique local address and is valid only from the instance. For more information, see [Unique local address](#) on Wikipedia.

Note

The examples in this section use the IPv4 address of the IMDS: 169.254.169.254. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: fd00:ec2::254. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on [Instances built on the Nitro System \(p. 218\)](#).

You can retrieve the instance identity document from a running instance at any time. The instance identity document includes the following information:

Data	Description
accountId	The ID of the AWS account that launched the instance.
architecture	The architecture of the AMI used to launch the instance (i386 x86_64 arm64).
availabilityZone	The Availability Zone in which the instance is running.
billingProducts	The billing products of the instance.
devpayProductCodes	Deprecated.
imageId	The ID of the AMI used to launch the instance.
instanceId	The ID of the instance.
instanceType	The instance type of the instance.
kernelId	The ID of the kernel associated with the instance, if applicable.
marketplaceProductCode	The AWS Marketplace product code of the AMI used to launch the instance.
pendingTime	The date and time that the instance was launched.
privateIp	The private IPv4 address of the instance.
ramdiskId	The ID of the RAM disk associated with the instance, if applicable.
region	The Region in which the instance is running.
version	The version of the instance identity document format.

Retrieve the plaintext instance identity document

To retrieve the plaintext instance identity document

Connect to the instance and run one of the following commands depending on the version of the IMDS used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> (Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content
```

IMDSv1

```
PS C:\> (Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content
```

The following is example output.

```
{  
    "devpayProductCodes" : null,  
    "marketplaceProductCodes" : [ "1abc2defghijklmnopqrstuvwxyz" ],  
    "availabilityZone" : "us-west-2b",  
    "privateIp" : "10.158.112.84",  
    "version" : "2017-09-30",  
    "instanceId" : "i-1234567890abcdef0",  
    "billingProducts" : null,  
    "instanceType" : "t2.micro",  
    "accountId" : "123456789012",  
    "imageId" : "ami-5fb8c835",  
    "pendingTime" : "2016-11-19T16:32:11Z",  
    "architecture" : "x86_64",  
    "kernelId" : null,  
    "ramdiskId" : null,  
    "region" : "us-west-2"  
}
```

Verify the instance identity document

If you intend to use the contents of the instance identity document for an important purpose, you should verify its contents and authenticity before using it.

The plaintext instance identity document is accompanied by three hashed and encrypted signatures. You can use these signatures to verify the origin and authenticity of the instance identity document and the information that it includes. The following signatures are provided:

- Base64-encoded signature—This is a base64-encoded SHA256 hash of the instance identity document that is encrypted using an RSA key pair.
- PKCS7 signature—This is a SHA1 hash of the instance identity document that is encrypted using a DSA key pair.
- RSA-2048 signature—This is a SHA256 hash of the instance identity document that is encrypted using an RSA-2048 key pair.

Each signature is available at a different endpoint in the instance metadata. You can use any one of these signatures depending on your hashing and encryption requirements. To verify the signatures, you must use the corresponding AWS public certificate.

The following topics provide detailed steps for validating the instance identity document using each signature.

- [Use the PKCS7 signature to verify the instance identity document \(p. 899\)](#)
- [Use the base64-encoded signature to verify the instance identity document \(p. 905\)](#)
- [Use the RSA-2048 signature to verify the instance identity document \(p. 911\)](#)

Use the PKCS7 signature to verify the instance identity document

This topic explains how to verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate.

Prerequisites

This procedure requires the `System.Security` Microsoft .NET Core class. To add the class to your PowerShell session, run the following command.

```
PS C:\> Add-Type -AssemblyName System.Security
```

Note

The command adds the class to the current PowerShell session only. If you start a new session, you must run the command again.

To verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate

1. Connect to the instance.
2. Retrieve the PKCS7 signature from the instance metadata, convert it to a byte array, and add it to a variable named `$Signature`. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/pkcs7).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/pkcs7).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named `$Document`. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

IMDSv1

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Create a new file named `certificate.pem` and add one of the following AWS DSA public certificates, depending on your Region.

Other AWS Regions

The following AWS public certificate is for all AWS Regions, except Cape Town, Hong Kong, Hyderabad, Jakarta, Melbourne, China, Milan, Spain, Zurich, Tel Aviv, Bahrain, and UAE.

-----END CERTIFICATE-----

- Extract the certificate from the certificate file and store it in a variable named \$Store.

```
PS C:\> $Store =
[Security.Cryptography.X509Certificates.X509Certificate2Collection]::new([Security.Cryptography.X509Certificates.X509Certificate2]::FromFile("certificate.pem"))
```

- Verify the signature.

```
PS C:\> $SignatureDocument = [Security.Cryptography.Pkcs.SignedCms]::new()
```

```
PS C:\> $SignatureDocument.Decode($Signature)
```

```
PS C:\> $SignatureDocument.CheckSignature($Store, $true)
```

If the signature is valid, the command returns no output. If the signature cannot be verified, the command returns Exception calling "CheckSignature" with "2" argument(s): "Cannot find the original signer. If your signature cannot be verified, contact AWS Support.

- Validate the content of the instance identity document.

```
PS C:\> $SignatureDocument.ContentInfo.Content.SequenceEqual($Document)
```

If the content of the instance identity document is valid, the command returns True. If instance identity document cannot be validated, contact AWS Support.

Use the base64-encoded signature to verify the instance identity document

This topic explains how to verify the instance identity document using the base64-encoded signature and the AWS RSA public certificate.

To validate the instance identity document using the base64-encoded signature and the AWS RSA public certificate

- Connect to the instance.
- Retrieve the base64-encoded signature from the instance metadata, convert it to a byte array, and add it to variable named \$Signature. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/signature).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/signature).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named \$Document. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

IMDSv1

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Add one of the following AWS RSA public certificates to a new file named certificate.pem, depending on the Region of your instance.

Other AWS Regions

The following AWS public certificate is for all AWS Regions, except Cape Town, Hong Kong, Hyderabad, Jakarta, Melbourne, China, Milan, Spain, Zurich, Tel Aviv, Bahrain, UAE, and GovCloud.

```

- Verify the instance identity document.

```
PS C:\> [Security.Cryptography.X509Certificates.X509Certificate2]::new((Resolve-  
Path certificate.pem)).PublicKey.Key.VerifyData($Document, 'SHA256', $Signature)
```

If the signature is valid, the command returns `True`. If the signature cannot be verified, contact AWS Support.

Use the RSA-2048 signature to verify the instance identity document

This topic explains how to verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate.

Prerequisites

This procedure requires the `System.Security` Microsoft .NET Core class. To add the class to your PowerShell session, run the following command.

```
PS C:\> Add-Type -AssemblyName System.Security
```

Note

The command adds the class to the current PowerShell session only. If you start a new session, you must run the command again.

To verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate

- Connect to the instance.
- Retrieve the RSA-2048 signature from the instance metadata, convert it to a byte array, and add it to a variable named `$Signature`. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-  
ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/  
token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers @{'X-  
aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-  
identity/rsa2048).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest  
http://169.254.169.254/latest/dynamic/instance-identity/rsa2048).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named \$Document. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

IMDSv1

```
PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Create a new file named certificate.pem and add one of the following AWS RSA-2048 public certificates, depending on your Region.

North America Regions

- US East (Ohio)

```

```

5. Extract the certificate from the certificate file and store it in a variable named \$Store.

```
PS C:\> $Store = [Security.Cryptography.X509Certificates.X509Certificate2Collection]::new([Security.Cryptography.X509Certificates.X509Certificate2]::FromFile("certificate.pem"))
```

6. Verify the signature.

```
PS C:\> $SignatureDocument = [Security.Cryptography.Pkcs.SignedCms]::new()
```

```
PS C:\> $SignatureDocument.Decode($Signature)
```

```
PS C:\> $SignatureDocument.CheckSignature($Store, $true)
```

If the signature is valid, the command returns no output. If the signature cannot be verified, the command returns Exception calling "CheckSignature" with "2" argument(s): "Cannot find the original signer. If your signature cannot be verified, contact AWS Support.

7. Validate the content of the instance identity document.

```
PS C:\> $SignatureDocument.ContentInfo.Content.SequenceEqual($SignatureDocument.ContentInfo.Content, $Document)
```

If the content of the instance identity document is valid, the command returns True. If instance identity document cannot be validated, contact AWS Support.

Instance identity roles

Each instance that you launch has an *instance identity role* that represents its identity. An instance identity role is a type of IAM role. AWS services and features that are integrated to use the instance identity role can use it to identify the instance to the service.

The instance identity role credentials are accessible from the Instance Metadata Service (IMDS) at /identity-credentials/ec2/security-credentials/ec2-instance. The credentials consist of an AWS temporary access key pair and a session token. They are used to sign AWS Sigv4 requests to the AWS services that use the instance identity role. The credentials are present in the instance metadata regardless of whether a service or feature that makes use of instance identity roles is enabled on the instance.

Instance identity roles are automatically created when an instance is launched, have no role-trust policy document, and are not subject to any identity or resource policy.

Supported services

The following AWS services use the instance identity role:

- **Amazon EC2 – [EC2 Instance Connect](#)** uses the instance identity role to update the host keys for a Linux instance.
- **Amazon GuardDuty – [EKS Runtime Monitoring](#)** uses the instance identity role to allow the runtime agent to send security telemetry to the GuardDuty VPC endpoint.
- **AWS Security Token Service (AWS STS)** – Instance identity role credentials can be used with the AWS STS [GetCallerIdentity](#) action.
- **AWS Systems Manager** – When using [Default Host Management Configuration](#), AWS Systems Manager uses the identity provided by the instance identity role to register EC2 instances. After identifying your instance, Systems Manager can pass your AWSSystemsManagerDefaultEC2InstanceManagementRole IAM role to your instance.

Instance identity roles can't be used with other AWS services or features because they do not have an integration with instance identity roles.

Instance identity role ARN

The instance identity role ARN takes the following format:

```
arn:aws-partition:iam::account-number:assumed-role/aws:ec2-instance/instance-id
```

For example:

```
arn:aws:iam::0123456789012:assumed-role/aws:ec2-instance/i-0123456789example
```

For more information about ARNs, see [Amazon Resource Names \(ARNs\)](#) in the *IAM User Guide*.

Best practices and recommendations for SQL Server clustering in Amazon EC2

For information about SQL Server clustering in Amazon EC2, see [Best practices and recommendations for SQL Server clustering on Amazon EC2](#) in the *Microsoft SQL Server on Amazon EC2 User Guide*.

Install WSL on your Windows instance

Windows Subsystem for Linux (WSL) is a free download that you can install on your Windows instance. By installing WSL, you can run native Linux command line tools directly on your Windows instance and use the Linux tools for scripting, alongside your traditional Windows desktop. You can easily swap between Linux and Windows on a single Windows instance, which you might find useful in a development environment.

For more information about WSL, see the [Windows Subsystem for Linux Documentation](#) on the *Microsoft Build* website.

Limitations

- WSL is available in two versions: WSL 1 and WSL 2.
 - For .metal EC2 instances, you can install either WSL 1 or WSL 2.
 - For virtualized EC2 instances, you must install WSL 1.
- For Windows Server operating systems, WSL can only be installed on instances running the following:
 - Windows Server 2019

- Windows Server 2022

Install WSL

The following instructions install WSL on an EC2 instance running Windows Server 2022. For the instructions to install WSL on an EC2 instance running Windows Server 2019, see [Install WSL on previous versions of Windows Server](#) on the Microsoft website. After you've followed those instructions, you can use step 3 in the instructions below to configure WSL to use WSL 1.

To install WSL 1

1. To install WSL, run the following standard installation command on your EC2 instance, but make sure to enable WSL 1 by including `--enable-wsl1`. By default, WSL 2 is installed. If your instance was launched using a virtualized instance type, you must complete step 3 in this procedure to set the version to WSL 1.

```
wsl --install --enable-wsl1
```

2. Restart your EC2 instance.
3. To configure WSL to use WSL 1, run the following command on your instance. For more information about setting the WSL version, see [Manual installation steps for older versions of WSL](#) on the *Microsoft Build* website.

```
wsl --set-default-version 1
```

To install WSL 2

- To install WSL, run the following standard installation command on your EC2 instance. By default, WSL 2 is installed. If you are installing WSL on a `.metal` instance, then this is the only step to perform.

```
wsl --install
```

For more information, see [Install Linux on Windows with WSL](#) on the *Microsoft Build* website.

Upgrade an Amazon EC2 Windows instance to a newer version of Windows Server

There are two methods to upgrade an earlier version of Windows Server running on an instance: in-place upgrade and migration (also called side-by-side upgrade). An in-place upgrade upgrades the operating system files while your personal settings and files are intact. A migration involves capturing settings, configurations, and data and porting these to a newer operating system on a fresh Amazon EC2 instance.

Microsoft has traditionally recommended migrating to a newer version of Windows Server instead of upgrading. Migrating can result in fewer upgrade errors or issues, but can take longer than an in-place upgrade because of the need to provision a new instance, plan for and port applications, and adjust configurations settings on the new instance. An in-place upgrade can be faster, but software incompatibilities can produce errors.

Contents

- [Perform an in-place upgrade \(p. 928\)](#)

- [Perform an automated upgrade \(p. 932\)](#)
- [Migrate to latest generation instance types \(p. 940\)](#)
- [Windows to Linux replatforming assistant for Microsoft SQL Server Databases \(p. 946\)](#)
- [Troubleshoot an upgrade \(p. 953\)](#)

Perform an in-place upgrade

Before you perform an in-place upgrade, you must determine which network drivers the instance is running. PV network drivers enable you to access your instance using Remote Desktop. Starting with Windows Server 2008 R2, instances use either AWS PV, Intel Network Adapter, or the Enhanced Networking drivers. Instances with Windows Server 2003 and Windows Server 2008 use *Citrix PV* drivers. For more information, see [Paravirtual drivers for Windows instances \(p. 780\)](#).

Automated upgrades

For steps on how to use AWS Systems Manager to automate the upgrade of your Windows Server 2008 R2 to Server 2012 R2 or from SQL Server 2008 R2 on Windows Server 2012 R2 to SQL Server 2016, see [Upgrade Your End of Support Microsoft 2008 Workloads in AWS with Ease](#).

Before you begin an in-place upgrade

Complete the following tasks and note the following important details before you begin your in-place upgrade.

- Read the Microsoft documentation to understand the upgrade requirements, known issues, and restrictions. Also review the official instructions for upgrading.
 - [Upgrading to Windows Server 2008 R2](#)
 - [Upgrade Options for Windows Server 2012](#)
 - [Upgrade Options for Windows Server 2012 R2](#)
 - [Upgrade and conversion options for Windows Server 2016](#)
 - [Upgrade and conversion options for Windows Server 2019](#)
 - [Upgrade and conversion options for Windows Server 2022](#)
 - [Windows Server Upgrade Center](#)
- We recommend performing an operating system upgrade on instances with at least 2 vCPUs and 4GB of RAM. If needed, you can change the instance to a larger size of the same type (t2.small to t2.large, for example), perform the upgrade, and then resize it back to the original size. If you are required to retain the instance size, you can monitor the progress using the [instance console screenshot \(p. 2126\)](#). For more information, see [Change the instance type \(p. 344\)](#).
- Verify that the root volume on your Windows instance has enough free disk space. The Windows Setup process might not warn you of insufficient disk space. For information about how much disk space is required to upgrade a specific operating system, see the Microsoft documentation. If the volume does not have enough space, it can be expanded. For more information, see [Amazon EBS Elastic Volumes \(p. 1909\)](#).
- Determine your upgrade path. You must upgrade the operating system to the same architecture. For example, you must upgrade a 32-bit system to a 32-bit system. Windows Server 2008 R2 and later are 64-bit only.
- Disable antivirus and anti-spyware software and firewalls. These types of software can conflict with the upgrade process. Re-enable antivirus and anti-spyware software and firewalls after the upgrade completes.
- Update to the latest drivers as described in [Migrate to latest generation instance types \(p. 940\)](#).
- The Upgrade Helper Service only supports instances running Citrix PV drivers. If the instance is running Red Hat drivers, you must manually [upgrade those drivers \(p. 786\)](#) first.

Upgrade an instance in-place with AWS PV, Intel Network Adapter, or the Enhanced Networking drivers

Use the following procedure to upgrade a Windows Server instance using the AWS PV, Intel Network Adapter, or the Enhanced Networking network drivers.

To perform the in-place upgrade

1. Create an AMI of the system you plan to upgrade for either backup or testing purposes. You can then perform the upgrade on the copy to simulate a test environment. If the upgrade completes, you can switch traffic to this instance with little downtime. If the upgrade fails, you can revert to the backup. For more information, see [Create a custom Windows AMI \(p. 151\)](#).
2. Ensure that your Windows Server instance is using the latest network drivers. See [Upgrade PV drivers on Windows instances \(p. 786\)](#) for information on upgrading your AWS PV driver.
3. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
4. In the navigation pane, choose **Instances**. Locate the instance. Make a note of the instance ID and Availability Zone for the instance. You need this information later in this procedure.
5. If you are upgrading from Windows Server 2012 or 2012 R2 to Windows Server 2016, 2019, or 2022, perform the following on your instance before proceeding:
 - a. Uninstall the EC2Config service. For more information, see [Stop, restart, delete, or uninstall EC2Config \(p. 756\)](#).
 - b. Install EC2Launch v1 or the EC2Launch v2 agent. For more information, see [Configure a Windows instance using EC2Launch \(p. 743\)](#) and [Configure a Windows instance using EC2Launch v2 \(p. 692\)](#).
 - c. Install the AWS Systems Manager SSM Agent. For more information, see [Working with SSM Agent](#) in the [AWS Systems Manager User Guide](#).
6. Create a new volume from a Windows Server installation media snapshot.
 - a. In the left navigation pane, under **Elastic Block Store**, choose **Snapshots**. In the search bar filter, choose **Public Snapshots**.
 - b. Add the **Owner alias** filter to the search bar and choose **amazon**.
 - c. Add the **Description** filter and enter **Windows**. Select Enter.
 - d. Select the snapshot that matches the system architecture and language preference you are upgrading to. For example, select **Windows 2019 English Installation Media** to upgrade to Windows Server 2019.
 - e. Choose **Actions, Create Volume**.
 - f. In the **Create Volume** dialog box, choose the Availability Zone that matches your Windows instance, and choose **Create Volume**.
7. In the **Create Volume Request Succeeded** message, choose the volume that you just created.
8. Choose **Actions, Attach Volume**.
9. In the **Attach Volume** dialog box, enter the instance ID of your Windows instance and choose **Attach**.
10. Make the new volume available for use by following the steps at [Make an Amazon EBS volume available for use on Windows](#).

Important

Do not initialize the disk because doing so will delete the existing data.

11. In Windows PowerShell, switch to the new volume drive. Begin the upgrade by opening the installation media volume you attached to the instance.
 - a. If you are upgrading to Windows Server 2016 or later, run the following:

```
.\setup.exe /auto upgrade /dynamicupdate disable
```

Note

Running the setup.exe with the /dynamicupdate option set to disabled prevents Windows from installing updates during the Windows Server upgrade process, as installing updates during the upgrade can cause failures. You can install updates with Windows Update after the upgrade completes.

If you are upgrading to an earlier version of Windows Server, run the following:

```
Sources\setup.exe
```

- b. For **Select the operating system you want to install**, select the full installation SKU for your Windows Server instance, and choose **Next**.
- c. For **Which type of installation do you want?**, choose **Upgrade**.
- d. Complete the wizard.

Windows Server Setup copies and processes files. After several minutes, your Remote Desktop session closes. The time it takes to upgrade depends on the number of applications and server roles running on your Windows Server instance. The upgrade process could take as little as 40 minutes or several hours. The instance fails status check 1 of 2 during the upgrade process. When the upgrade completes, both status checks pass. You can check the system log for console output or use Amazon CloudWatch metrics for disk and CPU activity to determine whether the upgrade is progressing.

Note

If upgrading to Windows Server 2019, after the upgrade is complete you can change the desktop background manually to remove the previous operating system name if desired.

If the instance has not passed both status checks after several hours, see [Troubleshoot an upgrade \(p. 953\)](#).

Upgrade an instance in-place with Citrix PV drivers

Citrix PV drivers are used in Windows Server 2003 and 2008. There is a known issue during the upgrade process where Windows Setup removes portions of the Citrix PV drivers that enable you to connect to the instance by using Remote Desktop. To avoid this problem, the following procedure describes how to use the Upgrade Helper Service during your in-place upgrade.

Using the upgrade helper service

You must run the Upgrade Helper Service before you start the upgrade. After you run it, the utility creates a Windows service that runs during the post-upgrade steps to correct the driver state. The executable is written in C# and can run on .NET Framework versions 2.0 through 4.0.

When you run Upgrade Helper Service on the system *before* the upgrade, it performs the following tasks:

- Creates a new Windows service named `UpgradeHelperService`.
- Verifies that the Citrix PV drivers are installed.
- Checks for unsigned boot critical drivers and presents a warning if any are found. Unsigned boot critical drivers could cause system failure after the upgrade if the drivers are not compatible with the newer Windows Server version.

When you run Upgrade Helper Service on the system *after* the upgrade, it performs the following tasks:

- Enables the `RealTimeIsUniversal` registry key for the correct time synchronization.

- Restores the missing PV driver by executing the following command:

```
pnputil -i -a "C:\Program Files (x86)\Citrix\XenTools\*.inf"
```

- Installs the missing device by executing the following command:

```
C:\Temp\EC2DriverUtils.exe install "C:\Program Files (x86)\Citrix\XenTools\xevtchn.inf"
ROOT\XENEVTCHN
```

- Automatically removes UpgradeHelperService when complete.

Perform the upgrade on instances running Citrix PV drivers

To complete the upgrade, you must attach the installation media volume to your EC2 instance and use UpgradeHelperService.exe.

To upgrade a Windows Server instance running Citrix PV drivers

- Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
- In the navigation pane, choose **Instances** and locate the instance. Make a note of the instance ID and Availability Zone for the instance. You need this information later in this procedure.
- Create a new volume from a Windows Server installation media snapshot.
 - In the navigation pane, choose **Snapshots**, and next to the filter field, choose **Public snapshots**.
 - From the Search field, choose **Owner alias**, then =, then **amazon** (new console), or choose **Owner** and then **Amazon images** (old console).
 - From the Search field, choose **Description**, then : (contains), and then enter **Windows** (new console), or choose **Description** and then enter **Windows** (old console). Press Enter.
 - Select the snapshot that matches the system architecture of your instance. For example, **Windows 2012 Installation Media**.
 - Choose **Actions, Create volume from snapshot** (new console) or **Create Volume** (old console).
 - In the **Create volume** dialog box, select the Availability Zone that matches your Windows instance, and choose **Create volume**.
- (New console) From the navigation pane, choose **Volumes**, and then choose the volume that you just created
(Old console) In the **Volume Successfully Created** dialog box, choose the volume that you just created.
- Choose **Actions, Attach volume**.
- In the **Attach volume** dialog box, enter the instance ID and choose **Attach volume**.
- On your Windows instance, on the C:\ drive, create a folder named temp.

Important

This folder must be available in the same location after the upgrade. Creating the folder in a Windows system folder or a user profile folder, such as the desktop, can cause the upgrade to fail.

- [Download OSUpgrade.zip](#) and extract the files into the C:\temp folder.
- Run C:\temp\UpgradeHelperService.exe and review the C:\temp\Log.txt file for any warnings.
- Uninstall PowerShell from the Windows Server 2003 instance.
- Begin the upgrade by using Windows Explorer to open the installation media volume that you attached to the instance.
- Run the Sources\Setup.exe file.

13. For **Select the operating system you want to install**, select the full installation SKU for your Windows Server instance, and then choose **Next**.
14. For **Which type of installation do you want?**, choose **Upgrade**.
15. Complete the wizard.

Windows Server Setup copies and processes files. After several minutes, your Remote Desktop session closes. The time it takes to upgrade depends on the number of applications and server roles running on your Windows Server instance. The upgrade process could take as little as 40 minutes or several hours. The instance fails status check 1 of 2 during the upgrade process. When the upgrade completes, both status checks pass. You can check the system log for console output or use Amazon CloudWatch metrics for disk and CPU activity to determine whether the upgrade is progressing.

Post upgrade tasks

1. Log in to the instance to initiate an upgrade for the .NET Framework and reboot the system when prompted.
2. Install the latest version of the EC2Config service (Windows 2012 R2 and earlier) or EC2Launch (Windows 2016 and later). For more information, see [Install the latest version of EC2Config \(p. 755\)](#) or [Install the latest version of EC2Launch \(p. 745\)](#).
3. Install Microsoft hotfix [KB2800213](#).
4. Install Microsoft hotfix [KB2922223](#).
5. If you upgraded to Windows Server 2012 R2, we recommend that you upgrade the PV drivers to AWS PV drivers. If you upgraded on a Nitro-based instance, we recommend that you install or upgrade the NVME and ENA drivers. For more information, see [Windows Server 2012 R2](#), [Install or upgrade AWS NVMe drivers using PowerShell \(p. 799\)](#), or [Enable enhanced networking on Windows \(p. 1329\)](#).
6. Re-enable antivirus and anti-spyware software and firewalls.

Perform an automated upgrade

You can perform an automated upgrade of your Windows and SQL Server instances on AWS with AWS Systems Manager Automation runbooks.

Contents

- [Related services \(p. 932\)](#)
- [Execution options \(p. 933\)](#)
- [Upgrade Windows Server \(p. 934\)](#)
- [Upgrade SQL Server \(p. 937\)](#)

Related services

The following AWS services are used in the automated upgrade process:

- **AWS Systems Manager.** AWS Systems Manager is a powerful, unified interface for centrally managing your AWS resources. For more information, see the [AWS Systems Manager User Guide](#).
- AWS Systems Manager Agent (SSM Agent) is Amazon software that can be installed and configured on an Amazon EC2 instance, an on-premises server, or a virtual machine (VM). SSM Agent makes it possible for Systems Manager to update, manage, and configure these resources. The agent processes requests from the Systems Manager service in the AWS Cloud, and then runs them as specified in the request. For more information, see [Working with SSM Agent](#) in the [AWS Systems Manager User Guide](#).

- **AWS Systems Manager SSM runbooks.** An SSM runbook defines the actions that Systems Manager performs on your managed instances. SSM runbooks use JavaScript Object Notation (JSON) or YAML, and they include steps and parameters that you specify. This topic uses two Systems Manager SSM runbooks for automation. For more information, see [AWS Systems Manager Automation runbook reference](#) in the *AWS Systems Manager User Guide*.

Execution options

When you select **Automation** on the Systems Manager console, select **Execute**. After you select an Automation document, you are then prompted to choose an automation execution option. You choose from the following options. In the steps for the paths provided later in this topic, we use the **Simple execution** option.

Simple execution

Choose this option if you want to update a single instance but do not want to go through each automation step to audit the results. This option is explained in further detail in the upgrade steps that follow.

Rate control

Choose this option if you want to apply the upgrade to more than one instance. You define the following settings.

- **Parameter**

This setting, which is also set in Multi-Account and Region settings, defines how your automation branches out.

- **Targets**

Select the target to which you want to apply the automation. This setting is also set in Multi-Account and Region settings.

- **Parameter Values**

Use the values defined in the automation document parameters.

- **Resource Group**

In AWS, a resource is an entity you can work with. Examples include Amazon EC2 instances, AWS CloudFormation stacks, or Amazon S3 buckets. If you work with multiple resources, it might be useful to manage them as a group as opposed to moving from one AWS service to another for every task. In some cases, you may want to manage large numbers of related resources, such as EC2 instances that make up an application layer. In this case, you will likely need to perform bulk actions on these resources at one time.

- **Tags**

Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This categorization is useful when you have many resources of the same type. You can quickly identify a specific resource using the assigned tags.

- **Rate Control**

Rate Control is also set in Multi-Account and Region settings. When you set the rate control parameters, you define how many of your fleet to apply the automation to, either by target count or by percentage of the fleet.

Multi-Account and Region

In addition to the parameters specified under Rate Control that are also used in the Multi-Account and Region settings, there are two additional settings:

- **Accounts and organizational units (OUs)**

Specify multiple accounts on which you want to run the automation.

- **AWS Regions**

Specify multiple AWS Regions where you want to run the automation.

Manual execution

This option is similar to **Simple execution**, but allows you to step through each automation step and audit the results.

Upgrade Windows Server

The [AWSEC2-CloneInstanceAndUpgradeWindows](#) runbook creates an Amazon Machine Image (AMI) from a Windows Server instance in your account and upgrades this AMI to a supported version of your choice. This multi-step process can take up to two hours to complete.

To upgrade your Windows Server 2008 R2 instance to Windows Server 2016, 2019, or 2022, an in-place upgrade is performed twice, first from Windows Server 2008 R2 to Windows Server 2012 R2, and then from Windows Server 2012 R2 to Windows Server 2016, 2019, or 2022. Directly upgrading Windows Server 2008 R2 to Windows Server 2016, 2019, or 2022 is not supported.

In this workflow, the automation creates an AMI from the instance and then launches the new AMI in the subnet you provide. The automation workflow performs an in-place upgrade from Windows Server 2008 R2, 2016, 2019 to the selected version (Windows Server 2012 R2, 2016, 2019, or 2022). It also updates or installs the AWS drivers required by the upgraded instance. After the upgrade is complete, the workflow creates a new AMI and terminates the upgraded instance. If you upgrade from Windows Server 2008 R2 to Windows Server 2016, 2019, or 2022, the automation creates two AMIs because the in-place upgrade is performed twice.

There are two AMIs included in the automated upgrade process:

- **Current running instance.** The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter `KeepPreUpgradeImageBackUp` (default value is `false`, which means the AMI is deleted by default).
- **Upgraded AMI.** This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

Windows Server automated upgrade paths

The Systems Manager Automation runbook [AWSEC2-CloneInstanceAndUpgradeWindows](#) supports the following upgrade paths:

- Windows Server 2008 R2 to Windows Server 2012 R2
- Windows Server 2012 R2 to Windows Server 2016

- Windows Server 2012 R2 to Windows Server 2019
- Windows Server 2012 R2 to Windows Server 2022
- Windows Server 2016 to Windows Server 2019
- Windows Server 2016 to Windows Server 2022
- Windows Server 2019 to Windows Server 2022

Prerequisites

In order to automate your Windows Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *AWS Identity and Access Management User Guide*.
- [Select the option for how you want the automation to be run \(p. 933\)](#). The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see [Execution options \(p. 933\)](#).
- Verify that SSM Agent is installed on your instance. For more information see [Installing and configuring SSM Agent on Amazon EC2 instances for Windows Server](#).
- Windows PowerShell 3.0 or later must be installed on your instance.
- For instances that are joined to a Microsoft Active Directory domain, we recommend specifying a SubnetId that does not have connectivity to your domain controllers to help avoid hostname conflicts.
- The SubnetId specified must be a public subnet with the auto-assign public IPv4 address set to true. For more information, see [Modifying the Public IPv4 Addressing Attribute for Your Subnet](#) in the *Amazon VPC User Guide*.
- This Automation works with only Windows Server 2008 R2, 2012 R2, 2016, and 2019 instances.
- This Automation works on only Amazon EC2 instances with an unencrypted Amazon EBS root volume. If the specified instance has an encrypted root volume, the automation fails.
- Verify that the instance has 20 GB of free disk space in the boot disk.
- If the instance does not use a Windows license provided by AWS, then specify an Amazon EBS snapshot ID that includes Windows Server 2012 R2 installation media. To do this:
 1. Verify that the Amazon EC2 instance is running Windows Server 2012 or later.
 2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
 3. Right-click the ISO and mount it to an instance as, for example, drive E.
 4. Copy the content of the ISO from drive E:\ to drive D:\
 5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2 above.

Windows Server upgrade limitations

This automation doesn't support upgrading Windows domain controllers, clusters, or Windows desktop operating systems. In addition, this automation doesn't support Amazon EC2 instances for Windows Server with the following roles installed:

- Remote Desktop Session Host (RDSH)
- Remote Desktop Connection Broker (RDCB)
- Remote Desktop Virtualization Host (RDVH)
- Remote Desktop Web Access (RDWA)

Steps to perform an automated upgrade of Windows Server

Follow these steps to upgrade your Windows Server instance using the [AWSEC2-CloneInstanceAndUpgradeWindows](#) automation runbook.

1. Open Systems Manager from the **AWS Management Console**.
2. From the left navigation pane, under **Change Management**, choose **Automation**.
3. Choose **Execute automation**.
4. Search for the automation document called AWSEC2-CloneInstanceAndUpgradeWindows.
5. When the document name appears, select it. When you select it, the document details appear.
6. Choose **Execute automation** to input the parameters for this document. Leave **Simple execution** selected at the top of the page.
7. Enter the requested parameters based on the following guidance.

- InstanceID

Type: String

(Required) The instance running Windows Server 2008 R2, 2012 R2, 2016, or 2019 with the SSM agent installed.

- InstanceProfile.

Type: String

(Required) The IAM instance profile. This is the IAM role used to perform the Systems Manager automation against the Amazon EC2 instance and AWS AMIs. For more information, see [Create an IAM Instance Profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

- TargetWindowsVersion

Type: String

(Required) Select the target Windows version.

- SubnetId

Type: String

(Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (in order to download patches).

- KeepPreUpgradedBackUp

Type: String

(Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- RebootInstanceBeforeTakingImage

Type: String

(Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

8. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.
9. When the automation completes, you will see the AMI ID. You can launch the AMI to verify that the Windows OS is upgraded.

Note

It is not necessary for the automation to run all of the steps. The steps are conditional based on the behavior of the automation and instance. Systems Manager might skip some steps that are not required.

Additionally, some steps may time out. Systems Manager attempts to upgrade and install all of the latest patches. Sometimes, however, patches time out based on a definable timeout setting for the given step. When this happens, the Systems Manager automation continues to the next step to ensure that the internal OS is upgraded to the target Windows Server version.

10. After the automation completes, you can launch an Amazon EC2 instance using the AMI ID to review your upgrade. For more information about how to create an Amazon EC2 instance from an AWS AMI, see [How do I launch an EC2 instance from a custom Amazon Machine Image \(AMI\)?](#)

Upgrade SQL Server

The [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) script creates an AMI from an Amazon EC2 instance running SQL Server in your account, and then upgrades the AMI to a later version of SQL Server. This multi-step process can take up to two hours to complete.

In this workflow, the automation creates an AMI from the instance and then launches the new AMI in the subnet you provide. The automation then performs an in-place upgrade of SQL Server. After the upgrade is complete, the automation creates a new AMI before terminating the upgraded instance.

There are two AMIs included in the automated upgrade process:

- **Current running instance.** The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter `KeepPreUpgradeImageBackUp` (default value is `false`, which means the AMI is deleted by default).
- **Upgraded AMI.** This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

SQL Server automated upgrade paths

The [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) automation runbook supports the following upgrade paths:

- SQL Server 2008 to SQL Server 2017, 2016, or 2014
- SQL Server 2008 R2 to SQL Server 2017, 2016, or 2014
- SQL Server 2012 to SQL Server 2019, 2017, 2016, or 2014
- SQL Server 2014 to SQL Server 2019, 2017, or 2016
- SQL Server 2016 to SQL Server 2019 or 2017
- SQL Server 2017 to SQL Server 2019

Prerequisites

In order to automate your SQL Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *AWS Identity and Access Management User Guide*.
- [Select the option for how you want the automation to be run \(p. 933\)](#). The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see [Execution options \(p. 933\)](#).
- The Amazon EC2 instance must use Windows Server 2008 R2 or later and SQL Server 2008 or later.
- Verify that SSM Agent is installed on your instance. For more information, see [Working with SSM Agent on Amazon EC2 instances for Windows Server](#).
- Verify that the instance has 20 GB of free disk space in the instance boot disk.
- For instances that use a Bring Your Own License (BYOL) SQL Server version, the following additional prerequisites apply:
 - Provide an Amazon EBS snapshot ID that includes the target SQL Server installation media. To do this:
 1. Verify that the Amazon EC2 instance is running Windows Server 2008 R2 or later.
 2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
 3. Right-click the ISO and mount it to an instance as, for example, drive E.
 4. Copy the content of the ISO from drive E:\ to drive D:\
 5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2.

SQL Server automated upgrade limitations

The following limitations apply when using the [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) runbook to perform an automated upgrade:

- The upgrade can be performed on only a SQL Server using Windows authentication.
- Verify that no security patch updates are pending on the instances. Open **Control Panel**, then choose **Check for updates**.
- SQL Server deployments in HA and mirroring mode are not supported.

Steps to perform an automated upgrade of SQL Server

Follow these steps to upgrade your SQL Server using the [AWSEC2-CloneInstanceAndUpgradeSQLServer](#) automation runbook.

1. If you haven't already, download the SQL Server 2016 .iso file and mount it to the source server.
2. After the .iso file is mounted, copy all of the component files and place them on any volume of your choice.
3. Take an Amazon EBS snapshot of the volume and copy the snapshot ID onto a clipboard for later use. For more information about creating an EBS snapshot, see [Create Amazon EBS snapshots](#).
4. Attach the instance profile to the Amazon EC2 source instance. This allows Systems Manager to communicate with the EC2 instance and run commands on it after it is added to the AWS Systems Manager service. For this example, we named the role SSM-EC2-Profile-Role with the `AmazonSSMManagedInstanceCore` policy attached to the role. See [Create an IAM instance profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.
5. In the AWS Systems Manager console, in the left navigation pane, choose **Managed Instances**. Verify that your EC2 instance is in the list of managed instance. If you don't see your instance after a few minutes, see [Where Are My Instances?](#) in the *AWS Systems Manager User Guide*.
6. In the left navigation pane, under **Change Management** choose **Automation**.

7. Choose **Execute automation**.
8. Search for the automation document called AWSEC2-CloneInstanceAndUpgradeSQLServer.
9. Choose the AWSEC2-CloneInstanceAndUpgradeSQLServer SSM document, and then choose **Next**.
10. Ensure that the **Simple execution** option is selected.
11. Enter the requested parameters based on the following guidance.

- InstanceId

Type: String

(Required) The instance running SQL Server 2008 R2 (or later).

- IamInstanceProfile

Type: String

(Required) The IAM instance profile.

- SQLServerSnapshotId

Type: String

(Required) The Snapshot ID for the target SQL Server installation media. This parameter is not required for SQL Server license-included instances.

- SubnetId

Type: String

(Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (in order to download patches).

- KeepPreUpgradedBackUp

Type: String

(Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- RebootInstanceBeforeTakingImage

Type: String

(Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

- TargetSQLVersion

Type: String

(Optional) The target SQL Server version. The default is 2016.

12. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.
13. When **Execution status** shows **Success**, expand **Outputs** to view the AMI information. You can use the AMI ID to launch your SQL Server instance for the VPC of your choice.
14. Open the Amazon EC2 console. In the left navigation pane, choose **AMIs**. You should see the new AMI.
15. To verify that the new SQL Server version has been successfully installed, choose the new AMI and choose **Launch**.

16. Choose the type of instance that you want for the AMI, the VPC and subnet that you want to deploy to, and the storage that you want to use. Because you're launching the new instance from an AMI, the volumes are presented to you as an option to include within the new EC2 instance you are launching. You can remove any of these volumes, or you can add volumes.
17. Add a tag to help you identify your instance.
18. Add the security group or groups to the instance.
19. Choose **Launch Instance**.
20. Choose the tag name for the instance and select **Connect** under the **Actions** dropdown.
21. Verify that the new SQL Server version is the database engine on the new instance.

Migrate to latest generation instance types

The AWS Windows AMIs are configured with the default settings used by the Microsoft installation media, with some customizations. The customizations include drivers and configurations that support the latest generation instance types, which are instances built on the [Nitro System \(p. 218\)](#), such as an M5 or C5.

When migrating to [Nitro-based \(p. 218\)](#) instances, including bare metal instances, we recommend that you follow the steps in this topic in the following cases:

- If you are launching instances from custom Windows AMIs
- If you are launching instances from Windows AMIs provided by Amazon that were created before August 2018

For more information, see [Amazon EC2 Update — Additional Instance Types, Nitro System, and CPU Options](#).

Note

The following migration procedures can be performed on Windows Server version 2008 R2 and later. To migrate Linux instances to the latest generation instance types, see [Change the instance type](#).

Contents

- [Part 1: Install and upgrade AWS PV drivers \(p. 941\)](#)
- [Part 2: Install and upgrade ENA \(p. 942\)](#)
- [Part 3: Upgrade AWS NVMe drivers \(p. 942\)](#)
- [Part 4: Update EC2Config and EC2Launch \(p. 942\)](#)
- [Part 5: Install the serial port driver for bare metal instances \(p. 943\)](#)
- [Part 6: Update power management settings \(p. 943\)](#)
- [Part 7: Update Intel chipset drivers for new instance types \(p. 943\)](#)
- [\(Alternative\) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager \(p. 944\)](#)
- [Migrate to Xen instance types from Nitro instance types \(p. 945\)](#)

Note

Alternatively, you can use the `AWSsupport-UpgradeWindowsAWSDrivers` automation document to automate the procedures described in Part 1, Part 2, and Part 3. If you choose to use the automated procedure, see [\(Alternative\) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager \(p. 944\)](#), and then continue with Part 4 and Part 5.

Before you begin

This procedure assumes that you are currently running on a previous generation Xen-based instance type, such as an M4 or C4, and you are migrating to an instance based on the [Nitro System \(p. 218\)](#), such as an M5 or C5.

You must use PowerShell version 3.0 or later to successfully perform the upgrade.

Note

When migrating to the latest generation instances, the static IP or custom DNS network settings on the existing ENI may be lost as the instance will default to a new Enhanced Networking Adapter device.

Before following the steps in this procedure, we recommend that you create a backup of the instance. From the [EC2 console](#), choose the instance that requires the migration, open the context (right-click) menu, and choose **Instance State, Stop**.

Warning

When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

Open the context (right-click) menu for the instance in the [EC2 console](#), choose **Image**, and then choose **Create Image**.

Note

Parts 4 and 5 of these instructions can be completed after you migrate or change the instance type to the latest generation, such as M5 or C5. However, we recommend that you complete them before you migrate if you are migrating specifically to an EC2 Bare Metal instance type.

Part 1: Install and upgrade AWS PV drivers

Though AWS PV drivers are not used in the Nitro system, you should still upgrade them if you are on previous versions of either Citrix PV or AWS PV. The latest AWS PV drivers resolve bugs in previous versions of the drivers that may appear while you are on a Nitro system, or if you need to migrate back to a Xen-based instance. As a best practice, we recommend always updating to the latest drivers for Windows instances on AWS.

Use the following procedure to perform an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers on Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, or Windows Server 2019. For more information, see [Upgrade PV drivers on Windows instances \(p. 786\)](#).

To upgrade a Domain Controller, see [Upgrade a domain controller \(AWS PV upgrade\) \(p. 787\)](#).

To perform an upgrade of or to AWS PV drivers

1. Connect to the instance using Remote Desktop and prepare the instance for upgrade. Take all non-system disks offline before you perform the upgrade. If you are performing an in-place update of AWS PV drivers, this step is not required. Set non-essential services to **Manual** start-up in the Services console.
2. [Download](#) the latest driver package to the instance.
3. Extract the contents of the folder and run `AWSVPDriverSetup.msi`.

After running the MSI, the instance automatically reboots and upgrades the driver. The instance may not be available for up to 15 minutes.

After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new driver was installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver

version is the same as the latest version listed in the Driver Version History table. For more information, see [AWS PV driver package history \(p. 782\)](#).

Part 2: Install and upgrade ENA

Upgrade to the latest Elastic Network Adapter driver to ensure that all network features are supported. If you launched your instance and it does not have enhanced networking already enabled, you must download and install the required network adapter driver on your instance. Then, set the enaSupport instance attribute to **activate enhanced networking**. You can only enable this attribute on supported instance types and only if the ENA driver is installed. For more information, see [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances \(p. 1327\)](#).

1. [Download](#) the latest driver to the instance.
2. Extract the zip archive.
3. Install the driver by running the `install.ps1` PowerShell script from the extracted folder.

Note

To avoid installation errors, run the `install.ps1` script as an administrator.

4. Check if your AMI has `enaSupport` activated. If not, continue by following the documentation at [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances \(p. 1327\)](#).

Part 3: Upgrade AWS NVMe drivers

AWS NVMe drivers are used to interact with Amazon EBS and SSD instance store volumes that are exposed as NVMe block devices in the Nitro system for better performance.

Important

The following instructions are modified specifically for when you install or upgrade AWS NVMe on a previous generation instance with the intention to migrate the instance to the latest generation instance type.

1. [Download](#) the latest driver package to the instance.
2. Extract the zip archive.
3. Install the driver by running `dpinst.exe`.
4. Open a PowerShell session and run the following command:

```
start rundll32.exe sppnp.dll,Sysprep_Generalize_Pnp -wait
```

Note

To apply the command, you must run the PowerShell session as an administrator. PowerShell (x86) versions will result in an error.

This command only runs sysprep on the device drivers. It does not run the full sysprep preparation.

5. For Windows Server 2008 R2 and Windows Server 2012, shut down the instance, change the instance type to a latest generation instance and start it, then proceed to Part 4. If you start the instance again on a previous generation instance type before migrating to a latest generation instance type, it will not boot. For other supported Windows AMIs, you can change the instance type anytime after the device sysprep.

Part 4: Update EC2Config and EC2Launch

For Windows instances, the latest EC2Config and EC2Launch utilities provide additional functionality and information when running on the Nitro system, including on EC2 Bare Metal. By default, the EC2Config

service is included in AMIs prior to Windows Server 2016. EC2Launch replaces EC2Config on Windows Server 2016 and later AMIs.

When the EC2Config and EC2Launch services are updated, new Windows AMIs from AWS include the latest version of the service. However, you must update your own Windows AMIs and instances with the latest version of EC2Config and EC2Launch.

To install or update EC2Config

1. Download and unzip the [EC2Config Installer](#).
2. Run EC2Install.exe. For a complete list of options, run EC2Install with the /? option. By default, setup displays prompts. To run the command with no prompts, use the /quiet option.

For more information, see [Install the latest version of EC2Config \(p. 755\)](#).

To install or update EC2Launch

1. If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the C:\ProgramData\Amazon\EC2-Windows\Launch\Config directory.
2. Download [EC2-Windows-Launch.zip](#) to a directory on the instance.
3. Download [install.ps1](#) to the same directory where you downloaded EC2-Windows-Launch.zip.
4. Run install.ps1.

Note

To avoid installation errors, run the install.ps1 script as an administrator.

5. If you made a backup of the EC2Launch configuration file, copy it to the C:\ProgramData\Amazon\EC2-Windows\Launch\Config directory.

For more information, see [Configure a Windows instance using EC2Launch \(p. 743\)](#).

Part 5: Install the serial port driver for bare metal instances

The i3.metal instance type uses a PCI-based serial device rather than an I/O port-based serial device. The latest Windows AMIs automatically use the PCI-based serial device and have the serial port driver installed. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.04.11 or later, you must install the Serial Port Driver to enable the serial device for EC2 features such as Password Generation and Console Output. The latest EC2Config and EC2Launch utilities also support i3.metal and provide additional functionality. Follow the steps in Part 4, if you have not yet done so.

To install the serial port driver

1. [Download](#) the serial driver package to the instance.
2. Extract the contents of the folder, open the context (right-click) menu for aws_ser.INF, and choose **install**.
3. Choose **Okay**.

Part 6: Update power management settings

The following update to power management settings sets displays to never turn off, which allows for graceful OS shutdowns on the Nitro system. All Windows AMIs provided by Amazon as of 2018.11.28 already have this default configuration.

1. Open a command prompt or PowerShell session.
2. Run the following commands:

```
powercfg /setacvalueindex 381b4222-f694-41f0-9685-ff5bb260df2e 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
powercfg /setacvalueindex 8c5e7fda-e8bf-4a96-9a85-a6e23a8c635c 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
powercfg /setacvalueindex a1841308-3541-4fab-bc81-f71556f20b4a 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
```

Part 7: Update Intel chipset drivers for new instance types

The `u-6tb1.metal`, `u-9tb1.metal`, and `u-12tb1.metal` instance types use hardware that requires chipset drivers that were not previously installed on Windows AMIs. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.11.19 or later, you must install the drivers using the Intel Chipset INF Utility.

To install the chipset drivers

1. [Download the chipset utility](#) to the instance.
2. Extract the files.
3. Run `SetupChipset.exe`.
4. Accept the Intel software license agreement and install the chipset drivers.
5. Reboot the instance.

(Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

The `AWSSupport-UpgradeWindowsAWSDrivers` automation document automates the steps described in Part 1, Part 2, and Part 3. This method can also repair an instance where the driver upgrades have failed.

The `AWSSupport-UpgradeWindowsAWSDrivers` automation document upgrades or repairs storage and network AWS drivers on the specified EC2 instance. The document attempts to install the latest versions of AWS drivers online by calling the AWS Systems Manager Agent (SSM Agent). If SSM Agent is not contactable, the document can perform an offline installation of the AWS drivers if explicitly requested.

Note

This procedure will fail on a domain controller. To update drivers on a domain controller, see [Upgrade a domain controller \(AWS PV upgrade\) \(p. 787\)](#).

To automatically upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager>.
2. Choose **Automation, Execute Automation**.
3. Choose the `AWSSupport-UpgradeWindowsAWSDrivers` automation document and then configure the following options in the **Input Parameters** section:

Instance ID

Enter the unique ID of the instance to upgrade.

AllowOffline

(Optional) Choose one of the following options:

- True — Choose this option to perform an offline installation. The instance is stopped and restarted during the upgrade process.

Warning

When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

- False — (Default) To perform an online installation, leave this option selected. The instance is restarted during the upgrade process.

Important

Online and offline upgrades create an AMI before attempting the upgrade operations. The AMI persists after the automation completes. Secure your access to the AMI, or delete it if it is no longer needed.

SubnetId

(Optional) Enter one of the following values:

- SelectedInstanceSubnet — (Default) The upgrade process launches the *helper* instance into the same subnet as the instance that is to be upgraded. The subnet must allow communication to the Systems Manager endpoints (ssm.*).
- CreateNewVPC — The upgrade process launches the *helper* instance into a new VPC. Use this option if you're not sure whether the target instance's subnet allows communication to the ssm.* endpoints. Your user must have permission to create a VPC.
- A specific subnet ID — Specify the ID of a specific subnet into which to launch the *helper* instance. The subnet must be in the same Availability Zone as the instance that is to be upgraded, and it must allow communication with the ssm.* endpoints.

4. Choose **Execute automation**.
5. Allow the upgrade to complete. It could take up to 10 minutes to complete an online upgrade, and up to 25 minutes to complete an offline upgrade.

Migrate to Xen instance types from Nitro instance types

The following procedure assumes that you are currently running on a Nitro-based instance type, such as M5 or C5, and that you are migrating to an instance based on the Xen System, such as M4 or C4. For instance type specifications, see [Amazon EC2 Instance Types](#). Perform the following steps before the migration to avoid errors during the booting process.

1. AWS PV drivers must be installed and upgraded on a Nitro instance before you migrate to a Xen instance. For steps to install and upgrade AWS PV drivers, see [Part 1: Install and upgrade AWS PV drivers \(p. 941\)](#).
2. Update to the latest EC2Launch v2 version. See [Migrate to EC2Launch v2 \(p. 700\)](#) for steps.
3. Open a PowerShell session and run the following command as an administrator to sysprep the device drivers. Running sysprep ensures that early boot storage drivers required for booting on Xen instances are properly registered with Windows.

Note

Running the command using PowerShell (x86) versions will result in an error. This command adds only the boot-critical device drivers to the critical device database. It does not run the full sysprep preparation.

```
Start-Process rundll32.exe sppnp.dll,Sysprep_Generalize_Pnp -wait
```

4. Perform the migration to a Xen instance type when the sysprep process completes.

Windows to Linux replatforming assistant for Microsoft SQL Server Databases

The Windows to Linux replatforming assistant for Microsoft SQL Server Databases service is a scripting tool. It helps you move existing Microsoft SQL Server workloads from a Windows to a Linux operating system. You can use the replatforming assistant with any Windows Server virtual machines (VMs) hosted in the cloud, or with on-premises environments running Microsoft SQL Server 2008 and later. The tool checks for common incompatibilities, exports databases from the Windows VM, and imports into an EC2 instance running Microsoft SQL Server 2017 on Ubuntu 16.04. The automated process results in a ready-to-use Linux VM configured with your selected SQL Server databases that can be used for experimenting and testing.

Contents

- [Concepts \(p. 946\)](#)
- [Related services \(p. 946\)](#)
- [How Windows to Linux replatforming assistant for Microsoft SQL Server works \(p. 947\)](#)
- [Components \(p. 947\)](#)
- [Setting up \(p. 947\)](#)
- [Get started \(p. 949\)](#)

Concepts

The following terminology and concepts are central to your understanding and use of the Windows to Linux replatforming assistant for Microsoft SQL Server Databases.

Backup

A Microsoft SQL Server backup copies data or log records from a Microsoft SQL Server database or its transaction log to a backup device, such as a disk. For more information, see [Backup Overview \(Microsoft SQL Server\)](#).

Restore

A logical and meaningful sequence for restoring a set of Microsoft SQL Server backups. For more information, see [Restore and recovery overview \(SQL Server\)](#).

Replatform

A Microsoft SQL Server database can be replatformed from an EC2 Windows instance to an EC2 Linux instance running Microsoft SQL Server. It can also be replatformed to the VMware Cloud running Microsoft SQL Server Linux on AWS.

Related services

[AWS Systems Manager \(Systems Manager\)](#) gives you visibility and control of your infrastructure on AWS. The Windows to Linux replatforming assistant for Microsoft SQL Server Databases uses Systems Manager to move your Microsoft SQL databases to Microsoft SQL Server on EC2 Linux. For more information about Systems Manager, see the [AWS Systems Manager User Guide](#).

How Windows to Linux replatforming assistant for Microsoft SQL Server works

Windows to Linux replatforming assistant for Microsoft SQL Server Databases allows you to migrate your Microsoft SQL Server databases from an on-premises environment or from an EC2 Windows instance to Microsoft SQL Server 2017 on EC2 Linux using backup and restore. For the destination EC2 Linux instance, you provide either the EC2 instance ID or the EC2 instance type with the subnet ID and EC2 Key Pair.

When you run the PowerShell script for the Windows to Linux replatforming assistant for Microsoft SQL Server Databases on the source Microsoft SQL Server databases, the Windows instance backs up the databases to an encrypted [Amazon Simple Storage Service \(S3\)](#) storage bucket. It then restores the backups to an existing Microsoft SQL Server on EC2 Linux instance, or it launches a new Microsoft SQL Server on EC2 Linux instance and restores the backups to the newly created instance. This process can be used to replatform your 2-tier databases running enterprise applications. It also enables you to replicate your database to Microsoft SQL Server on Linux to test the application while the source Microsoft SQL Server remains online. After testing, you can schedule application downtime and rerun the PowerShell backup script during your final cutover.

The entire replatforming process can also be automated and run unattended. You can run the Systems Manager SSM document [AWSEC2-SQLServerDBRestore](#) to import your existing database backup files into Microsoft SQL Server on EC2 Linux without using the PowerShell backup script.

Components

The Windows to Linux replatforming assistant for Microsoft SQL Server Databases script consists of two main components:

1. A [PowerShell backup script](#), which backs up on-premises Microsoft SQL Server databases to an Amazon S3 storage bucket. It then invokes the SSM Automation document [AWSEC2-SQLServerDBRestore](#) to restore the backups to a Microsoft SQL Server on EC2 Linux instance.
2. An SSM Automation document named AWSEC2-SQLServerDBRestore, which restores database backups to Microsoft SQL Server on EC2 Linux. This automation restores Microsoft SQL Server database backups stored in Amazon S3 to Microsoft SQL Server 2017 running on an EC2 Linux instance. You can provide your own EC2 instance running Microsoft SQL Server 2017 Linux, or the automation launches and configures a new EC2 instance with Microsoft SQL Server 2017 on Ubuntu 16.04. The automation supports the restoration of full, differential, and transactional log backups, and accepts multiple database backup files. The automation automatically restores the most recent valid backup of each database in the files provided. For more information, see [AWSEC2-SQLServerDBRestore](#).

Setting up

This section covers the steps necessary to run the Windows to Linux replatforming script.

Contents

- [Prerequisites \(p. 947\)](#)
- [Prerequisites for replatforming to an existing EC2 instance \(p. 949\)](#)

Prerequisites

In order to run the Windows to Linux replatforming assistant for Microsoft SQL Server Databases script, you must do the following:

1. Install the AWS PowerShell module

To install the AWS PowerShell module, follow the steps listed in [Installing the AWS Tools for PowerShell on Windows](#). We recommend that you use PowerShell 3.0 or later for the backup script to work properly.

2. Install the Windows to Linux replatforming assistant PowerShell backup script

To run the Windows to Linux replatforming assistant, download the PowerShell backup script: [MigrateSQLServerToEC2Linux.ps1](#).

3. Add an AWS user profile to the AWS SDK store

To add and configure the AWS user profile, see the steps listed in [Managing Profiles](#) in the *AWS Tools for PowerShell User Guide*. [Set the following IAM policy](#) for your user profile.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "VisualEditor0",  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "arn:aws:iam::123456789012:role/DevTeam"  
        },  
        {  
            "Sid": "VisualEditor1",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RebootInstances",  
                "ssm:SendCommand",  
                "ssm:GetAutomationExecution",  
                "ec2:DescribeInstances",  
                "ssm>ListCommands",  
                "ec2>CreateTags",  
                "s3>CreateBucket",  
                "ec2:RunInstances",  
                "s3>ListBucket",  
                "ssm:GetCommandInvocation",  
                "s3:PutEncryptionConfiguration",  
                "ec2:DescribeImages",  
                "s3:PutObject",  
                "s3:GetObject",  
                "ssm:StartAutomationExecution",  
                "ssm:DescribeInstanceInformation",  
                "s3>DeleteObject",  
                "ssm>ListCommandInvocations",  
                "s3>DeleteBucket",  
                "ec2:DescribeInstanceStatus"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

4. Create an IAM instance profile role

To create an IAM instance profile role in order to run Systems Manager on EC2 Linux, see the steps listed under [Create an IAM instance profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

Prerequisites for replatforming to an existing EC2 instance

To replatform to an existing instance running Microsoft SQL Server 2017 on Linux, you must:

1. Configure the EC2 instance with an AWS Identity and Access Management (IAM) instance profile and attach the AmazonSSMManagedInstanceCore managed policy.

For information about creating an IAM instance profile for Systems Manager and attaching it to an instance, see the following topics in the *AWS Systems Manager User Guide*:

- [Create an IAM instance profile for Systems Manager](#)
 - [Attach an IAM instance profile to an Amazon EC2 instance](#)
2. Verify that SSM Agent is installed on your EC2 instance. For more information, see [Working with SSM Agent on EC2 instances for Windows Server](#) in the *AWS Systems Manager User Guide*.
 3. Verify that the EC2 instance has enough free disk space to download and restore the Microsoft SQL Server backups.

Get started

This section contains the PowerShell parameter definitions and scripts for replatforming your databases. For more information about how to use PowerShell scripts, see [PowerShell](#).

Topics

- [Run the Windows to Linux replatforming assistant for Microsoft SQL Server script \(p. 949\)](#)
- [Parameters \(p. 950\)](#)

Run the Windows to Linux replatforming assistant for Microsoft SQL Server script

The following common scenarios and example PowerShell scripts demonstrate how to replatform your Microsoft SQL Server databases using Windows to Linux replatforming assistant for Microsoft SQL Server Databases.

Important

The Windows to Linux Replatforming Assistant for Microsoft SQL Server Databases resets the SQL Server server administrator (SA) user password on the target instance every time that it is run. After the replatform process is complete, you must set your own SA user password before you can connect to the target SQL Server instance.

Syntax

The Windows to Linux replatforming assistant for Microsoft SQL Server Databases script adheres to the syntax shown in the following example.

```
PS C:\> C:\MigrateSQLServerToEC2Linux.ps1 [[-SqlServerInstanceName] <String>] [[-DBNames]<Object[]>] [-MigrateAllDBs] [PathForBackup] <String> [-SetSourceDBModeReadOnly] [-IamInstanceProfileName] <String>[-AWSRegion] <String> [[-EC2InstanceId] <String>] [[-EC2InstanceType] <String>] [[-EC2KeyPair] <String>] [[-SubnetId] <String>] [[-AWSProfileName] <String>] [[-AWSProfileLocation] <String>] [-GeneratePresignedUrls] [<CommonParameters>]
```

Example 1: Move a database to an EC2 instance

The following example shows how to move a database named AdventureDB to an EC2 Microsoft SQL Server on Linux instance, with an instance ID of i-024689abcdef, from the Microsoft SQL Server Instance named MSSQLSERVER. The backup directory to be used is D:\\Backup and the AWS Region is us-east-2.

```
PS C:\> ./MigrateSQLServerToEC2Linux.ps1 - SQLServerInstanceName MSSQLSERVER -  
EC2InstanceId i-024689abcdef -DBNames AdventureDB -PathForBackup D:\\Backup -AWSRegion us-east-2 -  
IamInstanceProfileName AmazonSSMManagedInstanceCore
```

Example 2: Move a database to an EC2 instance using the AWS credentials profile

The following example shows how to move the database in Example 1 using the AWS credentials profile: DBMigration.

```
PS C:\> ./MigrateSQLServerToEC2Linux.ps1 - SQLServerInstanceName MSSQLSERVER -  
EC2InstanceId i-024689abcdef -DBNames AdventureDB -PathForBackup D:\\Backup -AWSRegion us-east-2 -  
AWSProfileName DBMigration -IamInstanceProfileName AmazonSSMManagedInstanceCore
```

Example 3: Move a database to a new m5.large type instance

The following example shows how to create an m5.large type EC2 Linux instance in subnet-abc127 using the Key Pair customer-ec2-keypair and then moving AdventureDB and TestDB to the new instance from the database used in Examples 1 and 2.

```
PS C:\> ./MigrateSQLServerToEC2Linux.ps1 -EC2InstanceType m5.large -SubnetId subnet-abc127  
-EC2KeyPair customer-ec2-keypair -DBNames AdventureDB,TestDB -PathForBackup D:\\Backup -AWSRegion us-east-2 -  
AWSProfileName DBMigration -IamInstanceProfileName AmazonSSMManagedInstanceCore
```

Example 4: Move all databases to a new m5.large type instance

The following example shows how to create an m5.large type EC2 Linux instance in subnet-abc127 using the Key Pair customer-ec2-keypair and then migrating all databases to the instance from databases used in Examples 1 and 2.

```
PS C:\> ./MigrateSQLServerToEC2Linux.ps1 -EC2InstanceType m5.large -SubnetId subnet-abc127  
-EC2KeyPair customer-ec2-keypair -MigrateAllDBs -PathForBackup D:\\Backup -AWSRegion us-east-2 -  
AWSProfileName DBMigration -IamInstanceProfileName AmazonSSMManagedInstanceCore
```

Parameters

The following parameters are used by the PowerShell script to replatform your Microsoft SQL Server databases.

-SqlServerInstanceName

The name of the Microsoft SQL Server instance to be backed up. If a value for \$env:ComputerName is not provided, \$env:ComputerName is used by default.

Type: String

Required: No

-DBNames

The names of the databases to be backed up and restored. Specify the names of the databases in a comma-separated list (for example, adventureDB,universityDB). Either the DBNames or MigrateAllDBs parameter is required.

Type: Object

Required: No

-MigrateAllDBs

This switch is disabled by default. If this switch is enabled, the automation migrates all databases except for the system databases (master, msdb, tempdb). Either the DBNames or MigrateAllDBs parameter is required.

Type: SwitchParameter

Required: No

-PathForBackup

The path where the full backup is stored.

Type: String

Required: Yes

-SetSourceDBModeReadOnly

This switch is disabled by default. If this switch is enabled, it makes the database read-only during migration.

Type: SwitchParameter

Required: No

-IamInstanceProfileName

Enter the AWS IAM instance role with permissions to run Systems Manager Automation on your behalf. See [Getting Started with Automation](#) in the *AWS Systems Manager User Guide*.

Type: String

Required: Yes

-AWSRegion

Enter the AWS Region where your Amazon S3 buckets are created to store database backups.

Type: String

Required: Yes

-EC2InstanceId

To restore Microsoft SQL Server databases to an existing EC2 instance running Microsoft SQL Server Linux, enter the instance ID of the instance. Make sure that the EC2 instance already has the AWS Systems Manager SSM Agent installed and running.

Type: String

Required: No

-EC2InstanceType

To restore Microsoft SQL Server databases to a new EC2 Linux instance, enter the instance type of the instance to be launched.

Type: String

Required: No

-EC2KeyPair

To restore Microsoft SQL Server databases to a new EC2 Linux instance, enter the name of the EC2 Key Pair to be used to access the instance. This parameter is recommended if you are creating a new EC2 Linux instance.

Type: String

Required: No

-SubnetId

This parameter is required when creating a new EC2 Linux instance. When creating a new EC2 Linux instance, if SubnetId is not provided, the AWS user default subnet is used to launch the EC2 Linux instance.

Type: String

Required: No

-AWSProfileName

The name of the AWS profile that the automation uses when connecting to AWS services. For more information on the required user permissions, see [Getting Started with Automation](#) in the *AWS Systems Manager User Guide*. If a profile is not entered, the automation uses your default AWS profile.

Type: String

Required: No

-AWSProfileLocation

The location of the AWS Profile if the AWS Profile is not stored in the default location.

Type: String

Required: No

-GeneratePresignedUrls

This parameter is only used when replatforming to non-EC2 instances, such as to VMware Cloud on AWS or on-premises VMs.

Type: SwitchParameter

Required: No

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see [About Common Parameters](#) in the Microsoft PowerShell documentation.

Required: No

Troubleshoot an upgrade

AWS provides upgrade support for issues or problems with the Upgrade Helper Service, an AWS utility that helps you perform in-place upgrades involving Citrix PV drivers.

After the upgrade, the instance might temporarily experience higher than average CPU utilization while the .NET Runtime Optimization service optimizes the .NET framework. This is expected behavior.

If the instance has not passed both status checks after several hours, check the following.

- If you upgraded to Windows Server 2008 and both status checks fail after several hours, the upgrade may have failed and be presenting a prompt to **Click OK** to confirm rolling back. Because the console is not accessible at this state, there is no way to click the button. To get around this, perform a reboot via the Amazon EC2 console or API. The reboot takes ten minutes or more to initiate. The instance might become available after 25 minutes.
- Remove applications or server roles from the server and try again.

If the instance does not pass both status checks after removing applications or server roles from the server, do the following.

- Stop the instance and attach the root volume to another instance. For more information, see the description of how to stop and attach the root volume to another instance in "[Waiting for the metadata service](#)" (p. 2109).
- Analyze [Windows Setup log files and event logs](#) for failures.

For other issues or problems with an operating system upgrade or migration, we recommend reviewing the articles listed in [Before you begin an in-place upgrade](#) (p. 928).

Identify EC2 Windows instances

You might need to determine whether your application is running on an EC2 instance.

For information about identifying Linux instances, see [Identify EC2 Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Inspect the instance identity document

For a definitive and cryptographically verified method of identifying an EC2 instance, check the instance identity document, including its signature. These documents are available on every EC2 instance at the local, non-routable address <http://169.254.169.254/latest/dynamic/instance-identity/>. For more information, see [Instance identity documents](#) (p. 896).

Inspect the system UUID

You can get the system UUID and look for the presence of the characters "EC2" in the beginning octet of the UUID. This method to determine whether a system is an EC2 instance is quick but potentially inaccurate because there is a small chance that a system that is not an EC2 instance could have a UUID that starts with these characters. Furthermore, EC2 instances using SMBIOS 2.4 might represent the UUID in little-endian format, therefore the "EC2" characters do not appear at the beginning of the UUID.

Example : Get the UUID using WMI or Windows PowerShell

Use the Windows Management Instrumentation command line (WMIC) as follows:

```
wmic path win32_computersystemproduct get uuid
```

Alternatively, if you're using Windows PowerShell, use the **Get-WmiObject** cmdlet as follows:

```
PS C:\> Get-WmiObject -query "select uuid from Win32_ComputerSystemProduct" | Select UUID
```

In the following example output, the UUID starts with "EC2", which indicates that the system is probably an EC2 instance.

```
EC2AE145-D1DC-13B2-94ED-012345ABCDEF
```

For instances using SMBIOS 2.4, the UUID might be represented in little-endian format; for example:

```
45E12AEC-DCD1-B213-94ED-012345ABCDEF
```

Inspect the system virtual machine generation identifier

A virtual machine generation identifier consists of a unique buffer of 128-bit interpreted as cryptographic random integer identifier. You can retrieve the virtual machine generation identifier to identify your Amazon Elastic Compute Cloud instance. The generation identifier is exposed within the guest operating system of the instance through an ACPI table entry. The value will change if your machine is cloned, copied, or imported into AWS, such as with [VM Import/Export](#).

Example : Retrieve the virtual machine generation identifier from Windows

You can create a sample application to retrieve the virtual machine generation identifier from your instances running Windows. For more information, see [Obtaining the virtual machine generation identifier](#) in the Microsoft documentation.

Tutorial: Set up a Windows HPC cluster on Amazon EC2

You can launch a scalable Windows High Performance Computing (HPC) cluster using Amazon EC2 instances. A Windows HPC cluster requires an Active Directory domain controller, a DNS server, a head node, and one or more compute nodes.

To set up a Windows HPC cluster on Amazon EC2, complete the following tasks:

- [Step 1: Create your security groups \(p. 955\)](#)
- [Step 2: Set up your Active Directory domain controller \(p. 957\)](#)
- [Step 3: Configure your head node \(p. 958\)](#)
- [Step 4: Set up the compute node \(p. 959\)](#)
- [Step 5: Scale your HPC compute nodes \(optional\) \(p. 961\)](#)

For more information about high performance computing, see [High Performance Computing \(HPC\) on AWS](#).

Prerequisites

You must launch your instances in a VPC. You can use the default VPC or create a nondefault VPC. For more information, see [Getting Started](#) in the *Amazon VPC User Guide*.

Step 1: Create your security groups

Use the Tools for Windows PowerShell to create security groups for the domain controller, domain members, and the HPC cluster.

To create the security groups

1. Use the [New-EC2SecurityGroup](#) cmdlet to create the security group for the domain controller. Note the ID of the security group in the output.

```
PS C:\> New-EC2SecurityGroup -VpcId vpc-id -GroupName "SG - Domain Controller" -Description "Active Directory Domain Controller"
```

2. Use the [New-EC2SecurityGroup](#) cmdlet to create the security group for the domain members. Note the ID of the security group in the output.

```
PS C:\> New-EC2SecurityGroup -VpcId vpc-id -GroupName "SG - Domain Member" -Description "Active Directory Domain Member"
```

3. Use the [New-EC2SecurityGroup](#) cmdlet to create the security group for the HPC cluster. Note the ID of the security group in the output.

```
PS C:\> New-EC2SecurityGroup -VpcId vpc-id -GroupName "SG - Windows HPC Cluster" -Description "Windows HPC Cluster Nodes"
```

To add rules to the security groups

1. Create the following rules to add to the domain controller security group. Replace the placeholder security group ID with the ID of the domain member security group and the placeholder CIDR block with the CIDR block of your network.

```
PS C:\> $sg_dm = New-Object Amazon.EC2.Model.UserIdGroupPair
PS C:\> $sg_dm.GroupId = "sg-12345678
PS C:\> $r1 = @{ IpProtocol="UDP"; FromPort="123"; ToPort="123"; UserIdGroupPairs=$sg_dm }
PS C:\> $r2 = @{ IpProtocol="TCP"; FromPort="135"; ToPort="135"; UserIdGroupPairs=$sg_dm }
PS C:\> $r3 = @{ IpProtocol="UDP"; FromPort="138"; ToPort="138"; UserIdGroupPairs=$sg_dm }
PS C:\> $r4 = @{ IpProtocol="TCP"; FromPort="49152"; ToPort="65535"; UserIdGroupPairs=$sg_dm }
PS C:\> $r5 = @{ IpProtocol="TCP"; FromPort="389"; ToPort="389"; UserIdGroupPairs=$sg_dm }
PS C:\> $r6 = @{ IpProtocol="UDP"; FromPort="389"; ToPort="389"; UserIdGroupPairs=$sg_dm }
PS C:\> $r7 = @{ IpProtocol="TCP"; FromPort="636"; ToPort="636"; UserIdGroupPairs=$sg_dm }
PS C:\> $r8 = @{ IpProtocol="TCP"; FromPort="3268"; ToPort="3269"; UserIdGroupPairs=$sg_dm }
PS C:\> $r9 = @{ IpProtocol="TCP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=$sg_dm }
PS C:\> $r10 = @{ IpProtocol="UDP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=$sg_dm }
```

```
PS C:\> $r11 = @{ IpProtocol="TCP"; FromPort="88"; ToPort="88"; UserIdGroupPairs=$sg_dm }
PS C:\> $r12 = @{ IpProtocol="UDP"; FromPort="88"; ToPort="88"; UserIdGroupPairs=$sg_dm }
PS C:\> $r13 = @{ IpProtocol="TCP"; FromPort="445"; ToPort="445"; UserIdGroupPairs=$sg_dm }
PS C:\> $r14 = @{ IpProtocol="UDP"; FromPort="445"; ToPort="445"; UserIdGroupPairs=$sg_dm }
PS C:\> $r15 = @{ IpProtocol="ICMP"; FromPort="-1"; ToPort="-1"; UserIdGroupPairs=$sg_dm }
PS C:\> $r16 = @{ IpProtocol="UDP"; FromPort="53"; ToPort="53"; IpRanges="203.0.113.25/32" }
PS C:\> $r17 = @{ IpProtocol="TCP"; FromPort="3389"; ToPort="3389"; IpRanges="203.0.113.25/32" }
```

2. Use the [Grant-EC2SecurityGroupIngress](#) cmdlet to add the rules to the domain controller security group.

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId sg-1a2b3c4d -IpPermission @($r1, $r2, $r3, $r4, $r5, $r6, $r7, $r8, $r9, $r10, $r11, $r12, $r13, $r14, $r15, $r16, $r17)
```

For more information about these security group rules, see the following Microsoft article: [How to configure a firewall for domains and trusts](#).

3. Create the following rules to add to the domain member security group. Replace the placeholder security group ID with the ID of the domain controller security group.

```
PS C:\> $sg_dc = New-Object Amazon.EC2.Model.UserIdGroupPair
PS C:\> $sg_dc.GroupId = "sg-1a2b3c4d"
PS C:\> $r1 = @{ IpProtocol="TCP"; FromPort="49152"; ToPort="65535"; UserIdGroupPairs=$sg_dc }
PS C:\> $r2 = @{ IpProtocol="UDP"; FromPort="49152"; ToPort="65535"; UserIdGroupPairs=$sg_dc }
PS C:\> $r3 = @{ IpProtocol="TCP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=$sg_dc }
PS C:\> $r4 = @{ IpProtocol="UDP"; FromPort="53"; ToPort="53"; UserIdGroupPairs=$sg_dc }
```

4. Use the [Grant-EC2SecurityGroupIngress](#) cmdlet to add the rules to the domain member security group.

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission @($r1, $r2, $r3, $r4)
```

5. Create the following rules to add to the HPC cluster security group. Replace the placeholder security group ID with the ID of the HPC cluster security group and the placeholder CIDR block with the CIDR block of your network.

```
$sg_hpc = New-Object Amazon.EC2.Model.UserIdGroupPair
PS C:\> $sg_hpc.GroupId = "sg-87654321"
PS C:\> $r1 = @{ IpProtocol="TCP"; FromPort="80"; ToPort="80"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r2 = @{ IpProtocol="TCP"; FromPort="443"; ToPort="443"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r3 = @{ IpProtocol="TCP"; FromPort="1856"; ToPort="1856"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r4 = @{ IpProtocol="TCP"; FromPort="5800"; ToPort="5800"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r5 = @{ IpProtocol="TCP"; FromPort="5801"; ToPort="5801"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r6 = @{ IpProtocol="TCP"; FromPort="5969"; ToPort="5969"; UserIdGroupPairs=$sg_hpc }
```

```
PS C:\> $r7 = @{ IpProtocol="TCP"; FromPort="5970"; ToPort="5970"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r8 = @{ IpProtocol="TCP"; FromPort="5974"; ToPort="5974"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r9 = @{ IpProtocol="TCP"; FromPort="5999"; ToPort="5999"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r10 = @{ IpProtocol="TCP"; FromPort="6729"; ToPort="6730"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r11 = @{ IpProtocol="TCP"; FromPort="7997"; ToPort="7997"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r12 = @{ IpProtocol="TCP"; FromPort="8677"; ToPort="8677"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r13 = @{ IpProtocol="TCP"; FromPort="9087"; ToPort="9087"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r14 = @{ IpProtocol="TCP"; FromPort="9090"; ToPort="9092"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r15 = @{ IpProtocol="TCP"; FromPort="9100"; ToPort="9163"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r16 = @{ IpProtocol="TCP"; FromPort="9200"; ToPort="9263"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r17 = @{ IpProtocol="TCP"; FromPort="9794"; ToPort="9794"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r18 = @{ IpProtocol="TCP"; FromPort="9892"; ToPort="9893"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r19 = @{ IpProtocol="UDP"; FromPort="9893"; ToPort="9893"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r20 = @{ IpProtocol="TCP"; FromPort="6498"; ToPort="6498"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r21 = @{ IpProtocol="TCP"; FromPort="7998"; ToPort="7998"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r22 = @{ IpProtocol="TCP"; FromPort="8050"; ToPort="8050"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r23 = @{ IpProtocol="TCP"; FromPort="5051"; ToPort="5051"; UserIdGroupPairs=$sg_hpc }
PS C:\> $r24 = @{ IpProtocol="TCP"; FromPort="3389"; ToPort="3389"; IpRanges="203.0.113.25/32" }
```

6. Use the [Grant-EC2SecurityGroupIngress](#) cmdlet to add the rules to the HPC cluster security group.

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId sg-87654321 -IpPermission @($r1, $r2, $r3, $r4, $r5, $r6, $r7, $r8, $r9, $r10, $r11, $r12, $r13, $r14, $r15, $r16, $r17, $r18, $r19, $r20, $r21, $r22, $r23, $r24)
```

For more information about these security group rules, see the following Microsoft article: [HPC Cluster Networking: Windows Firewall configuration](#).

7. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
8. In the navigation pane, choose **Security Groups**. Verify that the all three security groups appear in the list and have the required rules.

Step 2: Set up your Active Directory domain controller

The Active Directory domain controller provides authentication and centralized resource management of the HPC environment and is required for the installation. To set up your Active Directory, launch an instance to serve as the domain controller for your HPC cluster and configure it.

To launch a domain controller for your HPC cluster

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. On the console dashboard, choose **Launch Instance**.
3. On the **Choose an AMI** page, select an AMI for Windows Server, and choose **Select**.
4. On the next page of the wizard, select an instance type, then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, select your VPC from **Network** and a subnet from **Subnet**.
On the next page of the wizard, you can specify additional storage for your instance.
6. On the **Add Tags** page, enter **Domain Controller** as the value for the Name tag for the instance, and then choose **Next: Configure Security Group**.
7. On the **Configure Security Group** page, choose **Select an existing security group**, choose the SG - **Domain Controller** security group, and then choose **Review and Launch**.
8. Choose **Launch**.
9. In the navigation pane, choose **Elastic IPs**.
10. Choose **Allocate new address**. Choose **Allocate**. Choose **Close**.
11. Select the Elastic IP address you created, and choose **Actions, Associate address**. For **Instance**, choose the domain controller instance. Choose **Associate**.

Connect to the instance you created, and configure the server as a domain controller for the HPC cluster.

To configure your instance as a domain controller

1. Connect to your Domain Controller instance. For more information, see [Connect to your Windows instance](#).
2. Open **Server Manager**, and add the **Active Directory Domain Services** role.
3. Promote the server to a domain controller using Server Manager or by running **DCPromo.exe**.
4. Create a new domain in a new forest.
5. Type **hpc.local** as the fully qualified domain name (FQDN).
6. Select **Forest Functional Level as Windows Server 2008 R2**.
7. Ensure that the **DNS Server** option is selected, and then choose **Next**.
8. Select **Yes, the computer will use an IP address automatically assigned by a DHCP server (not recommended)**.
9. When prompted, choose **Yes** to continue.
10. Complete the wizard and then select **Reboot on Completion**.
11. Connect to the instance as **hpc.local\administrator**.
12. Create a domain user **hpc.local\hpcuser**.

Step 3: Configure your head node

An HPC client connects to the head node. The head node facilitates the scheduled jobs. You configure your head node by launching an instance, installing the HPC Pack, and configuring the cluster.

Launch an instance and then configure it as a member of the hpc.local domain and with the necessary user accounts.

To configure an instance as your head node

1. Launch an instance and name it **HPC-Head**. When you launch the instance, select both of these security groups: SG - Windows HPC Cluster and SG - Domain Member.
2. Connect to the instance and get the existing DNS server address using the following command:

```
IPConfig /all
```

3. Update the TCP/IPv4 properties of the HPC-Head NIC to include the Elastic IP address for the Domain Controller instance as the primary DNS, and then add the additional DNS IP address from the previous step.
4. Join the machine to the hpc.local domain using the credentials for hpc.local\administrator (the domain administrator account).
5. Add hpc.local\hpcuser as the local administrator. When prompted for credentials, use hpc.local\administrator, and then restart the instance.
6. Connect to **HPC-Head** as hpc.local\hpcuser.

To install the HPC Pack

1. Connect to your **HPC-Head** instance using the hpc.local\hpcuser account.
2. Using **Server Manager**, turn off Internet Explorer Enhanced Security Configuration (IE ESC) for Administrators.
 - a. In **Server Manager**, under **Security Information**, choose **Configure IE ESC**.
 - b. Turn off IE ESC for administrators.
3. Install the HPC Pack on **HPC-Head**.
 - a. Download the HPC Pack to HPC-Head from the [Microsoft Download Center](#). Choose the HPC Pack for the version of Windows Server on HPC-Head.
 - b. Extract the files to a folder, open the folder, and double-click **setup.exe**.
 - c. On the Installation page, select **Create a new HPC cluster by creating a head node**, and then choose **Next**.
 - d. Accept the default settings to install all the databases on the Head Node, and then choose **Next**.
 - e. Complete the wizard.

To configure your HPC cluster on the head node

1. Start **HPC Cluster Manager**.
2. In the **Deployment To-Do List**, select **Configure your network**.
 - a. In the wizard, select the default option (5), and then choose **Next**.
 - b. Complete the wizard accepting default values on all screens, and choose how you want to update the server and participate in customer feedback.
 - c. Choose **Configure**.
3. Select **Provide Network Credentials**, then provide the hpc.local\hpcuser credentials.
4. Select **Configure the naming of new nodes**, and then choose **OK**.
5. Select **Create a node template**.
 - a. Select the **Compute node template**, and then choose **Next**.
 - b. Select **Without operating system**, and then continue with the defaults.
 - c. Choose **Create**.

Step 4: Set up the compute node

You set up the compute node by launching an instance, installing the HPC Pack, and adding the node to your cluster.

First, launch an instance, and then configure it as a member of the hpc.local domain with the necessary user accounts.

To configure an instance for your compute node

1. Launch an instance and name it HPC-Compute. When you launch the instance, select the following security groups: **SG - Windows HPC Cluster** and **SG - Domain Member**.
2. Log in to the instance and get the existing DNS server address from **HPC-Compute** using the following command:

```
IPConfig /all
```

3. Update the TCP/IPv4 properties of the HPC-Compute NIC to include the Elastic IP address of the Domain Controller instance as the primary DNS. Then add the additional DNS IP address from the previous step.
4. Join the machine to the hpc.local domain using the credentials for hpc.local\administrator (the domain administrator account).
5. Add hpc.local\hpcuser as the local administrator. When prompted for credentials, use hpc.local\administrator, and then restart.
6. Connect to HPC-Compute as hpc.local\hpcuser.

To install the HPC Pack on the compute node

1. Connect to your HPC-Compute instance using the hpc.local\hpcuser account.
2. Using **Server Manager**, turn off Internet Explorer Enhanced Security Configuration (IE ESC) for Administrators.
 - a. In **Server Manager**, under **Security Information**, choose **Configure IE ESC**.
 - b. Turn off IE ESC for administrators.
3. Install the HPC Pack on HPC-Compute.
 - a. Download the HPC Pack to HPC-Compute from the [Microsoft Download Center](#). Choose the HPC Pack for the version of Windows Server on HPC-Compute.
 - b. Extract the files to a folder, open the folder, and double-click **setup.exe**.
 - c. On the **Installation** page, select **Join an existing HPC cluster by creating a new compute node**, and then choose **Next**.
 - d. Specify the fully-qualified name of the HPC-Head instance, and then choose the defaults.
 - e. Complete the wizard.

To complete your cluster configuration, from the head node, add the compute node to your cluster.

To add the compute node to your cluster

1. Connect to the HPC-Head instance as hpc.local\hpcuser.
2. Open **HPC Cluster Manager**.
3. Select **Node Management**.
4. If the compute node displays in the **Unapproved** bucket, right-click the node that is listed and select **Add Node**.
 - a. Select **Add compute nodes or broker nodes that have already been configured**.
 - b. Select the check box next to the node and choose **Add**.
5. Right-click the node and choose **Bring Online**.

Step 5: Scale your HPC compute nodes (optional)

To scale your compute nodes

1. Connect to the HPC-Compute instance as `hpc.local\hpcuser`.
2. Delete any files you downloaded locally from the HP Pack installation package. (You have already run setup and created these files on your image so they do not need to be cloned for an AMI.)
3. From `C:\Program Files\Amazon\Ec2ConfigService` open the file `sysprep2008.xml`.
4. At the bottom of `<settings pass="specialize">`, add the following section. Make sure to replace `hpc.local`, `password`, and `hpcuser` to match your environment.

```
<component name="Microsoft-Windows-UnattendedJoin" processorArchitecture="amd64"
    publicKeyToken="31bf3856ad364e35"
    language="neutral" versionScope="nonSxS" xmlns:wcm="http://schemas.microsoft.com/

</component>
```

5. Save `sysprep2008.xml`.
6. Choose **Start, All Programs, EC2ConfigService Settings**.
 - a. Choose the **General** tab, and clear the **Set Computer Name** check box.
 - b. Choose the **Bundle** tab, and then choose **Run Sysprep and Shutdown Now**.
7. Open the Amazon EC2 console.
8. In the navigation pane, choose **Instances**.
9. Wait for the instance status to show **Stopped**.
10. Select the instance, choose **Actions, Image and templates, Create image**.
11. Specify an image name and image description, and then choose **Create image** to create an AMI from the instance.
12. Start the original HPC-Compute instance that was shut down.
13. Connect to the head node using the `hpc.local\hpcuser` account.
14. From **HPC Cluster Manager**, delete the old node that now appears in an error state.
15. In the Amazon EC2 console, in the navigation pane, choose **AMIs**.
16. Use the AMI you created to add additional nodes to the cluster.

You can launch additional compute nodes from the AMI that you created. These nodes are automatically joined to the domain, but you must add them to the cluster as already configured nodes in **HPC Cluster Manager** using the head node and then bring them online.

EC2 Fleet and Spot Fleet

You can use an EC2 Fleet or a Spot Fleet to launch a fleet of instances. In a single API call, a fleet can launch multiple instance types across multiple Availability Zones, using the On-Demand Instance, Reserved Instance, and Spot Instance purchasing options together.

EC2 Fleet

An *EC2 Fleet* contains the configuration information to launch a fleet—or group—of instances. In a single API call, a fleet can launch multiple instance types across multiple Availability Zones, using the On-Demand Instance, Reserved Instance, and Spot Instance purchasing options together. Using EC2 Fleet, you can:

- Define separate On-Demand and Spot capacity targets and the maximum amount you’re willing to pay per hour
- Specify the instance types that work best for your applications
- Specify how Amazon EC2 should distribute your fleet capacity within each purchasing option

You can also set a maximum amount per hour that you’re willing to pay for your fleet, and EC2 Fleet launches instances until it reaches the maximum amount. When the maximum amount you’re willing to pay is reached, the fleet stops launching instances even if it hasn’t met the target capacity.

The EC2 Fleet attempts to launch the number of instances that are required to meet the target capacity specified in your request. If you specified a total maximum price per hour, it fulfills the capacity until it reaches the maximum amount that you’re willing to pay. The fleet can also attempt to maintain its target Spot capacity if your Spot Instances are interrupted. For more information, see [How Spot Instances work \(p. 400\)](#).

You can specify an unlimited number of instance types per EC2 Fleet. Those instance types can be provisioned using both On-Demand and Spot purchasing options. You can also specify multiple Availability Zones, specify different maximum Spot prices for each instance, and choose additional Spot options for each fleet. Amazon EC2 uses the specified options to provision capacity when the fleet launches.

While the fleet is running, if Amazon EC2 reclaims a Spot Instance because of a price increase or instance failure, EC2 Fleet can try to replace the instances with any of the instance types that you specify. This makes it easier to regain capacity during a spike in Spot pricing. You can develop a flexible and elastic resourcing strategy for each fleet. For example, within specific fleets, your primary capacity can be On-Demand supplemented with less-expensive Spot capacity if available.

If you have Reserved Instances and you specify On-Demand Instances in your fleet, EC2 Fleet uses your Reserved Instances. For example, if your fleet specifies an On-Demand Instance as `c4.large`, and you have Reserved Instances for `c4.large`, you receive the Reserved Instance pricing.

There is no additional charge for using EC2 Fleet. You pay only for the EC2 instances that the fleet launches for you.

Contents

- [EC2 Fleet limitations \(p. 963\)](#)
- [Burstable performance instances \(p. 963\)](#)
- [EC2 Fleet request types \(p. 964\)](#)
- [EC2 Fleet configuration strategies \(p. 982\)](#)
- [Work with EC2 Fleets \(p. 1006\)](#)

EC2 Fleet limitations

The following limitations apply to EC2 Fleet:

- EC2 Fleet is available only through the [Amazon EC2 API](#), [AWS CLI](#), [AWS SDKs](#), and [AWS CloudFormation](#).
- An EC2 Fleet request can't span AWS Regions. You need to create a separate EC2 Fleet for each Region.
- An EC2 Fleet request can't span different subnets from the same Availability Zone.

Burstable performance instances

If you launch your Spot Instances using a [burstable performance instance type \(p. 245\)](#), and if you plan to use your burstable performance Spot Instances immediately and for a short duration, with no idle time for accruing CPU credits, we recommend that you launch them in [Standard mode \(p. 260\)](#) to avoid paying higher costs. If you launch burstable performance Spot Instances in [Unlimited mode \(p. 253\)](#) and burst CPU immediately, you'll spend surplus credits for bursting. If you use the instance for a short duration, the instance doesn't have time to accrue CPU credits to pay down the surplus credits, and you are charged for the surplus credits when you terminate the instance.

Unlimited mode is suitable for burstable performance Spot Instances only if the instance runs long enough to accrue CPU credits for bursting. Otherwise, paying for surplus credits makes burstable performance Spot Instances more expensive than using other instances. For more information, see [When to use unlimited mode versus fixed CPU \(p. 255\)](#).

Launch credits are meant to provide a productive initial launch experience for T2 instances by providing sufficient compute resources to configure the instance. Repeated launches of T2 instances to access new

launch credits is not permitted. If you require sustained CPU, you can earn credits (by idling over some period), use [Unlimited mode \(p. 253\)](#) for T2 Spot Instances, or use an instance type with dedicated CPU.

EC2 Fleet request types

There are three types of EC2 Fleet requests:

`instant`

If you configure the request type as `instant`, EC2 Fleet places a synchronous one-time request for your desired capacity. In the API response, it returns the instances that launched, along with errors for those instances that could not be launched. For more information, see [Use an EC2 Fleet of type 'instant' \(p. 964\)](#).

`request`

If you configure the request type as `request`, EC2 Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

`maintain`

(Default) If you configure the request type as `maintain`, EC2 Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

All three types of requests benefit from an allocation strategy. For more information, see [Allocation strategies for Spot Instances \(p. 983\)](#).

Use an EC2 Fleet of type 'instant'

The EC2 Fleet of type `instant` is a synchronous one-time request that makes only one attempt to launch your desired capacity. The API response lists the instances that launched, along with errors for those instances that could not be launched. There are several benefits to using an EC2 Fleet of type `instant`, which are described in this article. Example configurations are provided at the end of the article.

For workloads that need a launch-only API to launch EC2 instances, you can use the `RunInstances` API. However, with `RunInstances`, you can only launch On-Demand Instances or Spot Instances, but not both in the same request. Furthermore, when you use `RunInstances` to launch Spot Instances, your Spot Instance request is limited to one instance type and one Availability Zone. This targets a single Spot capacity pool (a set of unused instances with the same instance type and Availability Zone). If the Spot capacity pool does not have sufficient Spot Instance capacity for your request, the `RunInstances` call fails.

Instead of using `RunInstances` to launch Spot Instances, we recommend that you rather use the `CreateFleet` API with the `type` parameter set to `instant` for the following benefits:

- **Launch On-Demand Instances and Spot Instances in one request.** An EC2 Fleet can launch On-Demand Instances, Spot Instances, or both. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price.
- **Increase the availability of Spot Instances.** By using an EC2 Fleet of type `instant`, you can launch Spot Instances following [Spot best practices](#) with the resulting benefits:
 - **Spot best practice: Be flexible about instance types and Availability Zones.**

Benefit: By specifying several instance types and Availability Zones, you increase the number of Spot capacity pools. This gives the Spot service a better chance of finding and allocating your desired Spot compute capacity. A good rule of thumb is to be flexible across at least 10 instance types for each workload and make sure that all Availability Zones are configured for use in your VPC.

- **Spot best practice: Use the capacity-optimized allocation strategy.**

Benefit: The capacity-optimized allocation strategy automatically provisions instances from the most-available Spot capacity pools. Because your Spot Instance capacity is sourced from pools with optimal capacity, this decreases the possibility that your Spot Instances will be interrupted when Amazon EC2 needs the capacity back.

- **Get access to a wider set of capabilities.** For workloads that need a launch-only API, and where you prefer to manage the lifecycle of your instance rather than let EC2 Fleet manage it for you, use the EC2 Fleet of type *instant* instead of the [RunInstances](#) API. EC2 Fleet provides a wider set of capabilities than RunInstances, as demonstrated in the following examples. For all other workloads, you should use Amazon EC2 Auto Scaling because it supplies a more comprehensive feature set for a wide variety of workloads, like ELB-backed applications, containerized workloads, and queue processing jobs.

AWS services like Amazon EC2 Auto Scaling and Amazon EMR use EC2 Fleet of type *instant* to launch EC2 instances.

Prerequisites for EC2 Fleet of type instant

For the prerequisites for creating an EC2 Fleet, see [EC2 Fleet prerequisites \(p. 1007\)](#).

How instant EC2 Fleet works

When working with an EC2 Fleet of type *instant*, the sequence of events is as follows:

1. Configure the [CreateFleet](#) request type as *instant*. For more information, see [Create an EC2 Fleet \(p. 1013\)](#). Note that after you make the API call, you can't modify it.
2. When you make the API call, EC2 Fleet places a synchronous one-time request for your desired capacity.
3. The API response lists the instances that launched, along with errors for those instances that could not be launched.
4. You can describe your EC2 Fleet, list the instances associated with your EC2 Fleet, and view the history of your EC2 Fleet.
5. After your instances have launched, you can [delete the fleet request](#). When deleting the fleet request, you can also choose to terminate the associated instances, or leave them running.
6. You can terminate the instances at any time.

Examples

The following examples show how to use EC2 Fleet of type *instant* for different use cases. For more information about using the EC2 CreateFleet API parameters, see [CreateFleet](#) in the *Amazon EC2 API Reference*.

Examples

- [Example 1: Launch Spot Instances with the capacity-optimized allocation strategy \(p. 966\)](#)
- [Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy \(p. 967\)](#)
- [Example 3: Launch Spot Instances using instance weighting \(p. 968\)](#)
- [Example 4: Launch Spot Instances within single Availability zone \(p. 970\)](#)
- [Example 5: Launch Spot Instances of single instance type within single Availability zone \(p. 971\)](#)
- [Example 6: Launch Spot Instances only if minimum target capacity can be launched \(p. 972\)](#)
- [Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone \(p. 974\)](#)
- [Example 8: Launch instances with multiple Launch Templates \(p. 975\)](#)
- [Example 9: Launch Spot Instance with a base of On-Demand Instances \(p. 977\)](#)

- [Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy \(p. 978\)](#)
- [Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy \(p. 980\)](#)

Example 1: Launch Spot Instances with the capacity-optimized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides.

- The launch template is identified by its launch template name and version number.
- The 12 launch template overrides specify 4 different instance types and 3 different subnets, each in a separate Availability Zone. Each instance type and subnet combination defines a Spot capacity pool, resulting in 12 Spot capacity pools.
- The target capacity for the fleet is 20 instances.
- The default purchasing option is spot, which results in the fleet attempting to launch 20 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

},
"Type": "instant"
}

```

Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy

You can optimally launch one Spot Instance at a time by making multiple EC2 Fleet API calls of type instant, by setting the TotalTargetCapacity to 1.

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch template overrides have 4 different instance types and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 1 instance, and the default purchasing option is spot, which results in the fleet attempting to launch a Spot Instance from one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy, to launch a Spot Instance from the most-available capacity pool.

```

{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {

    "TotalTargetCapacity": 1,
    "DefaultTargetCapacityType": "spot"
},
"Type": "instant"
}
```

Example 3: Launch Spot Instances using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight based on how many units of the workload can run on the instance assuming a unit of the workload requires a 15 GB of memory and 4 vCPUs. For example an m5.xlarge (4 vCPUs and 16 GB of memory) can run one unit and is weighted 1, m5.2xlarge (8 vCPUs and 32 GB of memory) can run 2 units and is weighted 2, and so on. The total target capacity is set to 40 units. The default purchasing option is spot, and the allocation strategy is capacity-optimized, which results in either 40 m5.xlarge (40 divided by 1), 20 m5.2xlarge (40 divided by 2), 10 m5.4xlarge (40 divided by 4), 5 m5.8xlarge (40 divided by 8), or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

For more information, see [EC2 Fleet instance weighting \(p. 1005\)](#).

}
```

[Example 5: Launch Spot Instances of single instance type within single Availability zone](#)

You can configure a fleet to launch all instances of the same instance type and in a single Availability Zone by setting the SpotOptions SingleInstanceType to true and SingleAvailabilityZone to true.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity is 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances of the same instance type all in a single AZ from the Spot Instance pool with optimal capacity using the launch specifications.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "SingleInstanceType": true,
        "SingleAvailabilityZone": true
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-e7188bab"
                },
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-49e41922"
                }
            ]
        }
    ]
}
```

```

        "SubnetId": "subnet-49e41922"
    },
    {
        "InstanceType": "c5d.4xlarge",
        "SubnetId": "subnet-fae8c380"
    },
    {
        "InstanceType": "c5d.4xlarge",
        "SubnetId": "subnet-e7188bab"
    },
    {
        "InstanceType": "c5d.4xlarge",
        "SubnetId": "subnet-49e41922"
    },
    {
        "InstanceType": "m5.4xlarge",
        "SubnetId": "subnet-fae8c380"
    },
    {
        "InstanceType": "m5.4xlarge",
        "SubnetId": "subnet-e7188bab"
    },
    {
        "InstanceType": "m5.4xlarge",
        "SubnetId": "subnet-49e41922"
    },
    {
        "InstanceType": "m5d.4xlarge",
        "SubnetId": "subnet-fae8c380"
    },
    {
        "InstanceType": "m5d.4xlarge",
        "SubnetId": "subnet-e7188bab"
    },
    {
        "InstanceType": "m5d.4xlarge",
        "SubnetId": "subnet-49e41922"
    }
]
}
],
{
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
}

```

Example 6: Launch Spot Instances only if minimum target capacity can be launched

You can configure a fleet to launch instances only if the minimum target capacity can be launched by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances from the Spot capacity pool with optimal capacity using the launch template overrides, only if it can launch all 20 instances at the same time.

```
{
    "SpotOptions": {
```

```
        "AllocationStrategy": "capacity-optimized",
        "MinTargetCapacity": 20
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-e7188bab"
                },
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-49e41922"
                },
                {
                    "InstanceType": "c5d.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "c5d.4xlarge",
                    "SubnetId": "subnet-e7188bab"
                },
                {
                    "InstanceType": "c5d.4xlarge",
                    "SubnetId": "subnet-49e41922"
                },
                {
                    "InstanceType": "m5.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "m5.4xlarge",
                    "SubnetId": "subnet-e7188bab"
                },
                {
                    "InstanceType": "m5.4xlarge",
                    "SubnetId": "subnet-49e41922"
                },
                {
                    "InstanceType": "m5d.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "m5d.4xlarge",
                    "SubnetId": "subnet-e7188bab"
                },
                {
                    "InstanceType": "m5d.4xlarge",
                    "SubnetId": "subnet-49e41922"
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
```

}

Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone

You can configure a fleet to launch instances only if the minimum target capacity can be launched with a single instance type in a single Availability Zone by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together along with SingleInstanceType and SingleAvailabilityZone options.

The 12 launch specifications which override the launch template, have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized, the SingleInstanceType is true and SingleAvailabilityZone is true. The EC2 Fleet launches 20 Spot Instances of the same Instance type all in a single AZ from the Spot capacity pool with optimal capacity using the launch specifications, only if it can launch all 20 instances at the same time.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized",  
        "SingleInstanceType": true,  
        "SingleAvailabilityZone": true,  
        "MinTargetCapacity": 20  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification":{  
                "LaunchTemplateName":"ec2-fleet-lt1",  
                "Version": "$Latest"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c5.4xlarge",  
                    "SubnetId": "subnet-fae8c380"  
                },  
                {  
                    "InstanceType": "c5.4xlarge",  
                    "SubnetId": "subnet-e7188bab"  
                },  
                {  
                    "InstanceType": "c5.4xlarge",  
                    "SubnetId": "subnet-49e41922"  
                },  
                {  
                    "InstanceType": "c5d.4xlarge",  
                    "SubnetId": "subnet-fae8c380"  
                },  
                {  
                    "InstanceType": "c5d.4xlarge",  
                    "SubnetId": "subnet-e7188bab"  
                },  
                {  
                    "InstanceType": "c5d.4xlarge",  
                    "SubnetId": "subnet-49e41922"  
                },  
                {  
                    "InstanceType": "m5.4xlarge",  
                    "SubnetId": "subnet-fae8c380"  
                },

                    "InstanceType": "m5.4xlarge",  
                    "SubnetId": "subnet-e7188bab"  
                }  
            ]  
        }  
    ]  
}
```

```

        },
        {
            "InstanceType": "m5.4xlarge",
            "SubnetId": "subnet-49e41922"
        },
        {
            "InstanceType": "m5d.4xlarge",
            "SubnetId": "subnet-fae8c380"
        },
        {
            "InstanceType": "m5d.4xlarge",
            "SubnetId": "subnet-e7188bab"
        },
        {
            "InstanceType": "m5d.4xlarge",
            "SubnetId": "subnet-49e41922"
        }
    ]
},
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 20,
    "DefaultTargetCapacityType": "spot"
},
"Type": "instant"
}

```

[Example 8: Launch instances with multiple Launch Templates](#)

You can configure a fleet to launch instances with different launch specifications for different instance types or a group of instance types, by specifying multiple launch templates. In this example we want have different EBS volume sizes for different instance types and we have that configured in the launch templates ec2-fleet-lt-4xl, ec2-fleet-lt-9xl and ec2-fleet-lt-18xl.

In this example, we are using 3 different launch templates for the 3 instance types based on their size. The launch specification overrides on all the launch templates use instance weights based on the vCPUs on the instance type. The total target capacity is 144 units, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet can either launch 9 c5n.4xlarge (144 divided by 16) using the launch template ec2-fleet-4xl or 4 c5n.9xlarge (144 divided by 36) using the launch template ec2-fleet-9xl, or 2 c5n.18xlarge (144 divided by 72) using the launch template ec2-fleet-18xl, or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

```

{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt-18xl",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5n.18xlarge",
                    "SubnetId": "subnet-fae8c380",
                    "WeightedCapacity": 72
                },
                {
                    "InstanceType": "c5n.18xlarge",
                    "SubnetId": "subnet-e7188bab",
                    "WeightedCapacity": 72
                }
            ]
        }
    ]
}

```

```

Example 9: Launch Spot Instance with a base of On-Demand Instances

The following example specifies the total target capacity of 20 instances for the fleet, and a target capacity of 5 On-Demand Instances. The default purchasing option is spot. The fleet launches 5 On-Demand Instance as specified, but needs to launch 15 more instances to fulfill the total target capacity. The purchasing option for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 15 Spot Instances from one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy.

}
```

Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy

You can configure a fleet to use On-Demand Capacity Reservations first when launching a base of On-Demand Instances with the default target capacity type as spot by setting the usage strategy for Capacity Reservations to use-capacity-reservations-first. And if multiple instance pools have unused Capacity Reservations, the chosen On-Demand allocation strategy is applied. In this example, the On-Demand allocation strategy is prioritized.

In this example, there are 6 available unused Capacity Reservations. This is less than the fleet's target On-Demand capacity of 10 On-Demand Instances.

The account has the following 6 unused Capacity Reservations in 2 pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

The following fleet configuration shows only the pertinent configurations for this example. The On-Demand allocation strategy is prioritized, and the usage strategy for Capacity Reservations is use-capacity-reservations-first. The Spot allocation strategy is capacity-optimized. The total target capacity is 20, the On-Demand target capacity is 10, and the default target capacity type is spot.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "OnDemandOptions": {
        "CapacityReservationOptions": {

```

```
        "UsageStrategy": "use-capacity-reservations-first"
    },
    "AllocationStrategy": "prioritized"
},
"LaunchTemplateConfigs": [
{
    "LaunchTemplateSpecification": {
        "LaunchTemplateName": "ec2-fleet-lt1",
        "Version": "$Latest"
    },
    "Overrides": [
        {
            "InstanceType": "c5.large",

            "Priority": 7.0
        },
        {
            "InstanceType": "m5.large",
            "SubnetId": "subnet-e7188bab",
            "Priority": 8.0
        },
        {
            "InstanceType": "m5.large",
            "SubnetId": "subnet-49e41922",
            "Priority": 9.0
        },
        {
            "InstanceType": "m5d.large",
            "SubnetId": "subnet-fae8c380",
            "Priority": 10.0
        },
        {
            "InstanceType": "m5d.large",
            "SubnetId": "subnet-e7188bab",
            "Priority": 11.0
        }
    ]
}
```

```
{  
    "InstanceType": "m5d.large",  
    "SubnetId": "subnet-49e41922",  
    "Priority": 12.0  
}  
]  
]  
],  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 20,  
    "OnDemandTargetCapacity": 10,  
    "DefaultTargetCapacityType": "spot"  
},  
"Type": "instant"  
}
```

After you create the instant fleet using the preceding configuration, the following 20 instances are launched to meet the target capacity:

- 7 c5.large On-Demand Instances in us-east-1a – c5.large in us-east-1a is prioritized first, and there are 3 available unused c5.large Capacity Reservations. The Capacity Reservations are used first to launch 3 On-Demand Instances plus 4 additional On-Demand Instances are launched according to the On-Demand allocation strategy, which is prioritized in this example.
- 3 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is prioritized second, and there are 3 available unused c3.large Capacity Reservations.
- 10 Spot Instances from one of the 12 Spot capacity pools that has the optimal capacity according to the capacity-optimized allocation strategy.

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the c5.large and m5.large Capacity Reservations were used.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "c5.large",  
    "AvailableInstanceCount": 0  
}
```

Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch specifications which override the launch template have 4 different instance types with a priority assigned, and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 20 instances, and the default purchasing option is spot, which results in the fleet attempting to launch 20 Spot Instances from one of the 12 Spot capacity pools based on the capacity-optimized-prioritized allocation strategy, which implements priorities on a best-effort basis, but optimizes for capacity first.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized-prioritized"
```

```
},
"LaunchTemplateConfigs": [
{

EC2 Fleet configuration strategies

An *EC2 Fleet* is a group of On-Demand Instances and Spot Instances.

The EC2 Fleet attempts to launch the number of instances that are required to meet the target capacity that you specify in the fleet request. The fleet can comprise only On-Demand Instances, only Spot Instances, or a combination of both On-Demand Instances and Spot Instances. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price. The fleet also attempts to maintain its target capacity if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and EC2 Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

A *Spot capacity pool* is a set of unused EC2 instances with the same instance type and Availability Zone. When you create an EC2 Fleet, you can include multiple launch specifications, which vary by instance type, Availability Zone, subnet, and maximum price. The fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your request, and the configuration of the request. The Spot Instances come from the selected pools.

An EC2 Fleet enables you to provision large amounts of EC2 capacity that makes sense for your application based on number of cores or instances, or amount of memory. For example, you can specify an EC2 Fleet to launch a target capacity of 200 instances, of which 130 are On-Demand Instances and the rest are Spot Instances.

Use the appropriate configuration strategies to create an EC2 Fleet that meets your needs.

Contents

- [Plan an EC2 Fleet \(p. 982\)](#)

Plan an EC2 Fleet

When planning your EC2 Fleet, we recommend that you do the following:

- Determine whether you want to create an EC2 Fleet that submits a synchronous or asynchronous one-time request for the desired target capacity, or one that maintains a target capacity over time. For more information, see [EC2 Fleet request types \(p. 964\)](#).
- Determine the instance types that meet your application requirements.
- If you plan to include Spot Instances in your EC2 Fleet, review [Spot Best Practices](#) before you create the fleet. Use these best practices when you plan your fleet so that you can provision the instances at the lowest possible price.
- Determine the target capacity for your EC2 Fleet. You can set target capacity in instances or in custom units. For more information, see [EC2 Fleet instance weighting \(p. 1005\)](#).
- Determine what portion of the EC2 Fleet target capacity must be On-Demand capacity and Spot capacity. You can specify 0 for On-Demand capacity or Spot capacity, or both.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.
- Determine the maximum amount per hour that you're willing to pay for your fleet. For more information, see [Control spending \(p. 1004\)](#).
- Review the possible options for your EC2 Fleet. For information about the fleet parameters, see [create-fleet](#) in the *AWS CLI Command Reference*. For EC2 Fleet configuration examples, see [EC2 Fleet example configurations \(p. 1106\)](#).

Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which EC2 Fleet can launch Spot Instances. However, when launching instances, EC2 Fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

You can specify one of the following allocation strategies:

price-capacity-optimized (recommended)

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. EC2 Fleet then requests Spot Instances from the lowest priced of these pools.

The **price-capacity-optimized** allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

capacity-optimized

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. You can optionally set a priority for each instance type in your fleet using **capacity-optimized-prioritized**. EC2 Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The **capacity-optimized** strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the **capacity-optimized** strategy can lower the overall cost of your workload.

Alternatively, you can use the capacity-optimized-prioritized allocation strategy with a priority parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. EC2 Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Using priorities is supported only if your fleet uses a launch template. Note that when you set the priority for capacity-optimized-prioritized, the same priority is also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

diversified

The Spot Instances are distributed across all Spot capacity pools.

lowest-price

The Spot Instances come from the lowest priced pool that has available capacity. This is the default strategy. However, we recommend that you override the default by specifying the price-capacity-optimized allocation strategy.

If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity.

If a pool runs out of capacity before fulfilling your desired capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools.

Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

InstancePoolsToUseCount

The number of Spot pools across which to allocate your target Spot capacity. Valid only when the allocation strategy is set to lowest-price. EC2 Fleet selects the lowest priced Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Choose the appropriate allocation strategy

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy. For On-Demand Instance target capacity, EC2 Fleet always selects the least expensive instance type based on the public On-Demand price, while following the allocation strategy—either price-capacity-optimized, capacity-optimized, diversified, or lowest-price—for Spot Instances.

Balance lowest price and capacity availability

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the price-capacity-optimized allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term, while still taking price into consideration.

If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the price-capacity-optimized allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point if they're interrupted. By using checkpointing, you make the price-capacity-optimized allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For an example configuration that uses the price-capacity-optimized allocation strategy, see [Example 11: Launch Spot Instances in a price-capacity-optimized fleet \(p. 1119\)](#).

When workloads have a high cost of interruption

You can optionally use the capacity-optimized strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload. For an example configuration that uses the capacity-optimized allocation strategy, see [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 1117\)](#).

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the capacity-optimized-prioritized allocation strategy and then setting the order of instance types to use from highest to lowest priority. For an example configuration, see [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 1118\)](#).

Note that using priorities is supported only if your fleet uses a launch template. Also note that when you set priorities for capacity-optimized-prioritized, the same priorities are also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

When your workload is time flexible and capacity availability is not a factor

If your fleet is small or runs for a short time, you can use price-capacity-optimized to maximize cost savings while still considering capacity availability.

If your workload is time flexible and capacity availability is not a factor, you can optionally use the lowest-price allocation strategy to maximize cost savings. Note, however, that because the lowest-price allocation strategy only considers instance price and not capacity availability, it might lead to high Spot Instance interruption rates.

When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the diversified strategy. For example, if your EC2 Fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the diversified strategy, the EC2 Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the [On-Demand price](#).

To create an inexpensive and diversified fleet, use the lowest-price strategy in combination with `InstancePoolsToUseCount`. For example, if your target capacity is 10 Spot Instances, and you specify 2 Spot capacity pools (for `InstancePoolsToUseCount`), EC2 Fleet will draw on the two lowest priced pools to fulfill your Spot capacity.

You can use a low or high number of Spot capacity pools across which to allocate your Spot Instances. For example, if you run batch processing, we recommend specifying a low number of Spot capacity

pools (for example, `InstancePoolsToUseCount=2`) to ensure that your queue always has compute capacity while maximizing savings. If you run a web service, we recommend specifying a high number of Spot capacity pools (for example, `InstancePoolsToUseCount=10`) to minimize the impact if a Spot capacity pool becomes temporarily unavailable.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, an EC2 Fleet of type `maintain` launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is `price-capacity-optimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is `capacity-optimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.
- If the allocation strategy is `diversified`, the fleet distributes the replacement Spot Instances across the remaining pools.
- If the allocation strategy is `lowest-price`, the fleet launches replacement instances in the pool where the Spot price is currently the lowest.
- If the allocation strategy is `lowest-price` in combination with `InstancePoolsToUseCount`, the fleet selects the Spot capacity pools with the lowest price and launches Spot Instances across the number of Spot capacity pools that you specify.

Attribute-based instance type selection for EC2 Fleet

When you create an EC2 Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as *attribute-based instance type selection*. For example, you can specify the minimum and maximum number of vCPUs required for your instances, and EC2 Fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

Benefits

Attribute-based instance type selection has the following benefits:

- With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.
- To manually specify multiple instance types for an EC2 Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide

multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.

- When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they're released, "future proofing" the fleet's configuration.
- When you specify instance attributes rather than instance types, EC2 Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility \(p. 398\)](#).

Topics

- [How attribute-based instance type selection works \(p. 987\)](#)
- [Considerations \(p. 989\)](#)
- [Create an EC2 Fleet with attribute-based instance type selection \(p. 989\)](#)
- [Examples of configurations that are valid and not valid \(p. 990\)](#)
- [Preview instance types with specified attributes \(p. 996\)](#)

How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. EC2 Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- [Types of instance attributes \(p. 987\)](#)
- [Where to configure attribute-based instance type selection \(p. 987\)](#)
- [How EC2 Fleet uses attribute-based instance type selection when provisioning a fleet \(p. 988\)](#)
- [Price protection \(p. 988\)](#)

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements. For a description of each attribute and the default values, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in the following fleet configuration component:

- In a launch template, and then reference the launch template in the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In a launch template override

If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- In a launch specification

How EC2 Fleet uses attribute-based instance type selection when provisioning a fleet

EC2 Fleet provisions a fleet in the following way:

- EC2 Fleet identifies the instance types that have the specified attributes.
- EC2 Fleet uses price protection to determine which instance types to exclude.
- EC2 Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- EC2 Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies. There might be a large number of instance types with the specified attributes, and some of them might be expensive. The default allocation strategy of lowest-price for Spot and On-Demand guarantees that EC2 Fleet will launch instances from the least expensive capacity pools.

If you specify an allocation strategy, EC2 Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the price-capacity-optimized, capacity-optimized, and lowest-price allocation strategies.
- For On-Demand Instances, attribute-based instance type selection supports the lowest-price allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

Price protection

Price protection is a feature that prevents your EC2 Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. When you create a fleet with attribute-based instance type selection, price protection is enabled by default, with separate thresholds for On-Demand Instances and Spot Instances. When Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold. The thresholds represent the maximum you'll pay, expressed as a percentage above the least expensive current generation M, C, or R instance type with your specified attributes.

If you don't specify a threshold, the following thresholds are used by default:

- For On-Demand Instances, the price protection threshold is set at 20 percent.
- For Spot Instances, the price protection threshold is set at 100 percent.

To specify the price protection threshold

While creating the EC2 Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

- To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `OnDemandMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.
- To specify the Spot Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `SpotMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

For more information about creating the fleet, see [Create an EC2 Fleet with attribute-based instance type selection \(p. 989\)](#).

Note

When creating the EC2 Fleet, if you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in an EC2 Fleet, but not both at the same time.

When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of four `InstanceRequirements` structures in a request configuration.

Create an EC2 Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the AWS CLI.

To create an EC2 Fleet with attribute-based instance type selection (AWS CLI)

Use the [create-fleet](#) (AWS CLI) command to create an EC2 Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 create-fleet \
  --region us-east-1 \
  --cli-input-json file://file_name.json
```

Example `file_name.json` file

The following example contains the parameters that configure an EC2 Fleet to use attribute-based instance type selection, and is followed by a text explanation.

```
{
  "SpotOptions": {
    "AllocationStrategy": "price-capacity-optimized"
  },
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "my-launch-template",
        "Version": "1"
      }
    },
    "Overrides": [
      {
        "InstanceRequirements": {
          "VCpuCount": {
            "Min": 2
          },
          "MemoryMiB": {
            "Min": 4
          }
        }
      }
    ]
}
```

```
        },
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. In this example, two attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [EC2 Fleet provisions the fleet \(p. 988\)](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Note

When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

The JSON also contains the following fleet configuration:

- `"AllocationStrategy": "price-capacity-optimized"` – The allocation strategy for the Spot Instances in the fleet.
- `"LaunchTemplateName": "my-launch-template"`, `"Version": "1"` – The launch template contains some instance configuration information, but if any instance types are specified, they will be overridden by the attributes that are specified in `InstanceRequirements`.
- `"TotalTargetCapacity": 20` – The target capacity is 20 instances.
- `"DefaultTargetCapacityType": "spot"` – The default capacity is Spot Instances.
- `"Type": "instant"` – The request type for the fleet is instant.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create an EC2 Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- [Valid configuration: Single launch template with overrides \(p. 991\)](#)
- [Valid configuration: Single launch template with multiple InstanceRequirements \(p. 992\)](#)

- [Valid configuration: Two launch templates, each with overrides \(p. 992\)](#)
- [Valid configuration: Only InstanceRequirements specified, no overlapping attribute values \(p. 993\)](#)
- [Configuration not valid: Overrides contain InstanceRequirements and InstanceType \(p. 994\)](#)
- [Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType \(p. 995\)](#)
- [Configuration not valid: Overlapping attribute values \(p. 995\)](#)

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one Overrides structure containing one InstanceRequirements structure. A text explanation of the example configuration follows.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "My-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceRequirements": {  
                        "VCpuCount": {  
                            "Min": 2,  
                            "Max": 8  
                        },  
                        "MemoryMib": {  
                            "Min": 0,  
                            "Max": 10240  
                        },  
                        "MemoryGiBPerVCpu": {  
                            "Max": 10000  
                        },  
                        "RequireHibernateSupport": true  
                    }  
                }  
            ]  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 5000,  
        "DefaultTargetCapacityType": "spot",  
        "TargetCapacityUnitType": "vcpu"  
    }  
}
```

InstanceRequirements

To use attribute-based instance selection, you must include the InstanceRequirements structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- VCpuCount – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- MemoryMiB – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- MemoryGiBPerVCpu – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The Min parameter is optional. By omitting it, you indicate no minimum limit.

TargetCapacityUnitType

The TargetCapacityUnitType parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is vcpu, which together specify a desired target capacity of 5,000 vCPUs. EC2 Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one Overrides structure containing two InstanceRequirements structures. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VCpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "MyLaunchTemplate",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceRequirements": {  
                        "VCpuCount": {  
                            "Min": 0,  
                            "Max": 2  
                        },  
                        "MemoryMiB": {  
                            "Min": 0  
                        }  
                    }  
                },  
                {  
                    "InstanceRequirements": {  
                        "VCpuCount": {  
                            "Min": 4,  
                            "Max": 8  
                        },  
                        "MemoryMiB": {  
                            "Min": 0  
                        }  
                    }  
                }  
            ]  
        },  
        {"TargetCapacitySpecification": {  
            "TotalTargetCapacity": 1,  
            "DefaultTargetCapacityType": "spot"  
        }  
    }  
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one Overrides structure containing one InstanceRequirements structure. This configuration is useful for arm and x86 architecture support in the same fleet.

```
{
```

```
"LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "armLaunchTemplate",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "x86LaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two LaunchTemplateSpecification structures, each with a launch template and an Overrides structure containing an InstanceRequirements structure. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VCpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
```

```
        "Min": 0,
        "Max": 2
    },
    "MemoryMiB": {
        "Min": 0
    }
}
],
{
    "LaunchTemplateSpecification": {
        "LaunchTemplateName": "MyOtherLaunchTemplate",
        "Version": "1"
    },
    "Overrides": [
        {
            "InstanceRequirements": {
                "VCpuCount": {
                    "Min": 4,
                    "Max": 8
                },
                "MemoryMiB": {
                    "Min": 0
                }
            }
        }
    ]
},
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 1,
    "DefaultTargetCapacityType": "spot"
}
}
}
```

Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
            ],
            {
                "InstanceType": "m5.large"
            }
        }
    ]
}
```

```
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
```

[Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType](#)

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.

```
{

}
```

Preview instance types with specified attributes

You can use the [get-instance-types-from-instance-requirements](#) AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the [get-instance-types-from-instance-requirements](#) command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

```
aws ec2 get-instance-types-from-instance-requirements \  
    --region us-east-1 \  
    --generate-cli-skeleton input > attributes.json
```

Expected output

```
{  
    "DryRun": true,
```

```
"ArchitectureTypes": [  
    "i386"  
,  
    "VirtualizationTypes": [  
        "hvm"

```

2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

Note

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

For a description of each attribute and their default values, see [get-instance-types-from-instance-requirements](#) in the *Amazon EC2 Command Line Reference*.

- For `ArchitectureTypes`, specify one or more types of processor architecture.
 - For `VirtualizationTypes`, specify one or more types of virtualization.
 - For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.
3. To preview the instance types that have the attributes that you specified in the JSON file, use the [get-instance-types-from-instance-requirements](#) command, and specify the name and path to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \  
    --cli-input-json file://attributes.json \  
    --output table
```

Example *attributes.json* file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{  
  
    "ArchitectureTypes": [  
        "x86_64"  
    ],  
    "VirtualizationTypes": [  
        "hvm"  
    ],  
    "InstanceRequirements": {  
        "VCpuCount": {  
            "Min": 4,  
            "Max": 6  
        },  
        "MemoryMiB": {  
            "Min": 16384,  
            "Max": 65536  
        }  
    }  
}
```

```
        "Min": 2048
    },
    "InstanceGenerations": [
        "current"
    ]
}
```

Example output

```
-----|GetInstanceTypesFromInstanceRequirements|
+-----+
||     InstanceTypes      ||
|+-----+
||     InstanceType       ||
|+-----+
||     c4.xlarge           ||
||     c5.xlarge            ||
||     c5a.xlarge           ||
||     c5ad.xlarge          ||
||     c5d.xlarge           ||
||     c5n.xlarge           ||
||     d2.xlarge            ||
...
...
```

4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

Configure EC2 Fleet for On-Demand backup

If you have urgent, unpredictable scaling needs, such as a news website that must scale during a major news event or game launch, we recommend that you specify alternative instance types for your On-Demand Instances, in the event that your preferred option does not have sufficient available capacity. For example, you might prefer c5.2xlarge On-Demand Instances, but if there is insufficient available capacity, you'd be willing to use some c4.2xlarge instances during peak load. In this case, EC2 Fleet attempts to fulfill all of your target capacity using c5.2xlarge instances, but if there is insufficient capacity, it automatically launches c4.2xlarge instances to fulfill the target capacity.

Topics

- [Prioritize instance types for On-Demand capacity \(p. 999\)](#)
- [Use Capacity Reservations for On-Demand Instances \(p. 1000\)](#)

Prioritize instance types for On-Demand capacity

When EC2 Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If `AllocationStrategy` is set to prioritized, EC2 Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity. The priority is assigned to the launch template override, and the highest priority is launched first.

Example: Prioritize instance types

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the least expensive instance type:

- m4.large – least expensive

- m5.large
- m5a.large

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the least expensive instance type.

However, say you have unused m5.large Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

- m5.large – priority 1
- m4.large – priority 2
- m5a.large – priority 3

Use Capacity Reservations for On-Demand Instances

With On-Demand Capacity Reservations, you can reserve compute capacity for your On-Demand Instances in a specified Availability Zone for any duration. You can configure an EC2 Fleet to use the Capacity Reservations first when launching On-Demand Instances.

Capacity Reservations are configured as either open or targeted. EC2 Fleet can launch On-Demand Instances into either open or targeted Capacity Reservations, as follows:

- If a Capacity Reservation is open, On-Demand Instances that have matching attributes automatically run in the reserved capacity.
- If a Capacity Reservation is targeted, On-Demand Instances must specifically target it to run in the reserved capacity. This is useful for using up specific Capacity Reservations or for controlling when to use specific Capacity Reservations.

If you use targeted Capacity Reservations in your EC2 Fleet, there must be enough Capacity Reservations to fulfil the target On-Demand capacity, otherwise the launch fails. To avoid a launch fail, rather add the targeted Capacity Reservations to a resource group, and then target the resource group. The resource group doesn't need to have enough Capacity Reservations; if it runs out of Capacity Reservations before the target On-Demand capacity is fulfilled, the fleet can launch the remaining target capacity into regular On-Demand capacity.

To use Capacity Reservations with EC2 Fleet

1. Configure the fleet as type instant. You can't use Capacity Reservations for fleets of other types.
2. Configure the usage strategy for Capacity Reservations as `use-capacity-reservations-first`.
3. In the launch template, for **Capacity reservation**, choose either **Open** or **Target by group**. If you choose **Target by group**, specify the Capacity Reservations resource group ID.

When the fleet attempts to fulfil the On-Demand capacity, if it finds that multiple instance pools have unused matching Capacity Reservations, it determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy (lowest-price or prioritized).

For examples of how to configure a fleet to use Capacity Reservations to fulfil On-Demand capacity, see [EC2 Fleet example configurations \(p. 1106\)](#), specifically Examples 5 through 7.

For information about configuring Capacity Reservations, see [On-Demand Capacity Reservations \(p. 504\)](#) and the [On-Demand Capacity Reservation FAQs](#).

Capacity Rebalancing

You can configure EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see [EC2 instance rebalance recommendations \(p. 429\)](#).

To configure EC2 Fleet to launch a replacement Spot Instance, use the [create-fleet](#) (AWS CLI) command and the relevant parameters in the MaintenanceStrategies structure. For more information, see the [example launch configuration \(p. 1116\)](#).

Limitations

- Capacity Rebalancing is available only for fleets of type `maintain`.
- When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The `ReplacementStrategy` for EC2 Fleet supports the following two values:

`launch-before-terminate`

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify `launch-before-terminate`, you must also specify a value for `termination-delay`. After the new replacement instances are launched, Amazon EC2 waits for the duration of the `termination-delay`, and then terminates the old instances. For `termination-delay`, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the `termination-delay`.

We strongly recommend against using the `lowest-price` allocation strategy in combination with `launch-before-terminate` to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

`launch`

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure an EC2 Fleet for Capacity Rebalancing, consider the following:

Provide as many Spot capacity pools in the request as possible

Configure your EC2 Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see [Be flexible about instance types and Availability Zones \(p. 398\)](#).

Avoid an elevated risk of interruption of replacement Spot Instances

Your replacement Spot Instances may be at an elevated risk of interruption if you use the lowest-price allocation strategy. This is because Amazon EC2 will always launch instances in the lowest-priced pool that has available capacity at that moment, even if your replacement Spot Instances are likely to be interrupted soon after being launched. To avoid an elevated risk of interruption, we strongly recommend against using the lowest-price allocation strategy, and instead recommend the capacity-optimized or capacity-optimized-prioritized allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see [Use the price and capacity optimized allocation strategy \(p. 398\)](#).

Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your [Spot Instance interruption rate \(p. 433\)](#) (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you'd waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances are interrupted. With a [Spot Instance interruption notice \(p. 440\)](#), you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing's proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- 2:00 PM – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- 2:30 PM – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
- 2:32 PM – If Capacity Rebalancing wasn't enabled, and if a Spot Instance interruption notice would've been received at 2:32 PM for instance-A, you would only have had up to two minutes to take action, but Instance-A would have been running up till this time.

* If `launch-before-terminate` is specified, Amazon EC2 will terminate the at-risk instance after the replacement instance comes online.

Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target capacity

When an EC2 Fleet is configured for Capacity Rebasing, the fleet attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of the fulfilled capacity. Depending on the replacement strategy, Amazon EC2 either terminates the instance after a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform [rebalancing actions \(p. 430\)](#) on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance recommendation, but no more replacement instances are launched because the fleet cannot exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

We recommend that you configure EC2 Fleet to terminate Spot Instances that receive a rebalance recommendation

If you configure your EC2 Fleet for Capacity Rebasing, we recommend that you choose `launch-before-terminate` with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform [rebalancing actions \(p. 430\)](#) on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see [Monitor rebalance recommendation signals \(p. 430\)](#).

EC2 Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out

If your EC2 Fleet is configured for Capacity Rebasing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- Scale in – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.

- Scale out – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so the fleet launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

Maximum price overrides

Each EC2 Fleet can either include a global maximum price, or use the default (the On-Demand price). The fleet uses this as the default maximum price for each of its launch specifications.

You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the EC2 Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

Control spending

EC2 Fleet stops launching instances when it has met one of the following parameters: the `TotalTargetCapacity` or the `MaxTotalPrice` (the maximum amount you're willing to pay). To control the amount you pay per hour for your fleet, you can specify the `MaxTotalPrice`. When the maximum total price is reached, EC2 Fleet stops launching instances even if it hasn't met the target capacity.

The following examples show two different scenarios. In the first, EC2 Fleet stops launching instances when it has met the target capacity. In the second, EC2 Fleet stops launching instances when it has reached the maximum amount you're willing to pay (`MaxTotalPrice`).

Example: Stop launching instances when target capacity is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `MaxTotalPrice`: \$1.50

EC2 Fleet launches 10 On-Demand Instances because the total of \$1.00 (10 instances x \$0.10) does not exceed the `MaxTotalPrice` of \$1.50 for On-Demand Instances.

Example: Stop launching instances when maximum total price is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `MaxTotalPrice`: \$0.80

If EC2 Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be \$1.00. This is more than the amount (\$0.80) specified for `MaxTotalPrice` for On-Demand Instances. To prevent spending more than you're willing to pay, EC2 Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the `MaxTotalPrice` for On-Demand Instances.

EC2 Fleet instance weighting

When you create an EC2 Fleet, you can define the capacity units that each instance type would contribute to your application's performance. You can then adjust your maximum price for each launch specification by using *instance weighting*.

By default, the price that you specify is *per instance hour*. When you use the instance weighting feature, the price that you specify is *per unit hour*. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. EC2 Fleet calculates the number of instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. The fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following table includes examples of calculations to determine the price per unit for an EC2 Fleet with a target capacity of 10.

Instance type	Instance weight	Target capacity	Number of instances launched	Price per instance hour	Price per unit hour
r3.xlarge	2	10	5 (10 divided by 2)	\$0.05	\$0.025 (.05 divided by 2)
r3.8xlarge	8	10	2 (10 divided by 8, result rounded up)	\$0.10	\$0.0125 (.10 divided by 8)

Use EC2 Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your EC2 Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch specification, specify the weight, which is the number of units that the instance type represents toward the target capacity.

Instance weighting example

Consider an EC2 Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type r3.2xlarge and a weight of 6
- A launch specification with an instance type c3.xlarge and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for r3.2xlarge per instance hour divided by 6), the EC2 Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for `c3.xlarge` per instance hour divided by 5), the EC2 Fleet would launch five of these instances (24 divided by 5, result rounded up).

Instance weighting and allocation strategy

Consider an EC2 Fleet request with the following configuration:

- A target capacity of 30 Spot Instances
- A launch specification with an instance type `c3.2xlarge` and a weight of 8
- A launch specification with an instance type `m3.xlarge` and a weight of 8
- A launch specification with an instance type `r3.xlarge` and a weight of 8

The EC2 Fleet would launch four instances (30 divided by 8, result rounded up). With the lowest-price strategy, all four instances come from the pool that provides the lowest price per unit. With the diversified strategy, the fleet launches one instance in each of the three pools, and the fourth instance in whichever of the three pools provides the lowest price per unit.

Work with EC2 Fleets

To start using an EC2 Fleet, you create a request that includes the total target capacity, On-Demand capacity, Spot capacity, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch template that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups. You can specify launch specification overrides for the instance type, subnet, Availability Zone, and maximum price you're willing to pay, and you can assign weighted capacity to each launch specification override.

The EC2 Fleet launches On-Demand Instances when there is available capacity, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

An EC2 Fleet request of type `maintain` or `request` remains active until it expires or you delete it. When you delete a fleet of type `maintain` or `request`, you can specify whether deletion terminates the instances in that fleet. Otherwise, the On-Demand Instances run until you terminate them, and the Spot Instances run until they are interrupted or you terminate them.

EC2 Fleet request states

An EC2 Fleet request can be in one of the following states:

submitted

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. The request can include On-Demand Instances, Spot Instances, or both.

active

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances. The request remains in this state until it is modified or deleted.

modifying

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed or the request is deleted. Only a maintain fleet type can be modified. This state does not apply to other request types.

deleted_running

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated manually. The request remains in this state until all instances are interrupted or terminated. Only an EC2 Fleet of type maintain or request can have running instances after the EC2 Fleet request is deleted. A deleted instant fleet with running instances is not supported. This state does not apply to instant fleets.

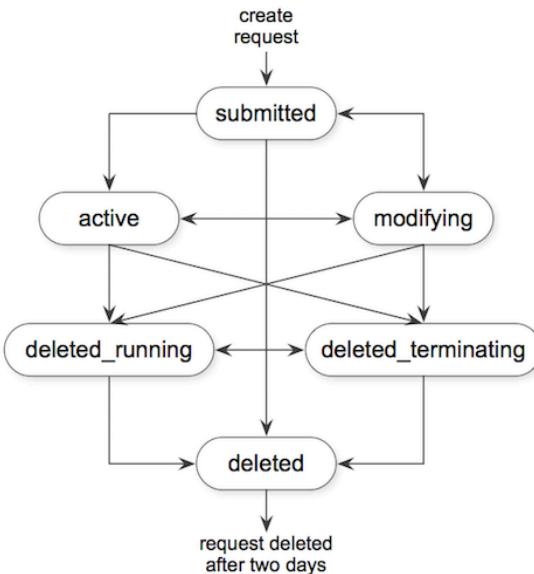

deleted_terminating

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

deleted

The EC2 Fleet is deleted and has no running instances. The request is deleted two days after its instances are terminated.

The following illustration represents the transitions between the EC2 Fleet request states. If you exceed your fleet limits, the request is deleted immediately.

EC2 Fleet prerequisites

To create an EC2 Fleet, the following prerequisites must be in place:

- [Launch template \(p. 1008\)](#)
- [Service-linked role for EC2 Fleet \(p. 1008\)](#)
- [Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots \(p. 1008\)](#)
- [Permissions for EC2 Fleet users \(p. 1009\)](#)

Launch template

A launch template includes information about the instances to launch, such as the instance type, Availability Zone, and the maximum price that you are willing to pay. For more information, see [Launch an instance from a launch template \(p. 567\)](#).

Service-linked role for EC2 Fleet

The **AWSServiceRoleForEC2Fleet** role grants the EC2 Fleet permission to request, launch, terminate, and tag instances on your behalf. Amazon EC2 uses this service-linked role to complete the following actions:

- `ec2:RunInstances` – Launch instances.
- `ec2:RequestSpotInstances` – Request Spot Instances.
- `ec2:TerminateInstances` – Terminate instances.
- `ec2:DescribeImages` – Describe Amazon Machine Images (AMIs) for the Spot Instances.
- `ec2:DescribeInstanceStatus` – Describe the status of the Spot Instances.
- `ec2:DescribeSubnets` – Describe the subnets for Spot Instances.
- `ec2:CreateTags` – Add tags to the EC2 Fleet, instances, and volumes.

Ensure that this role exists before you use the AWS CLI or an API to create an EC2 Fleet.

Note

An instant EC2 Fleet does not require this role.

To create the role, use the IAM console as follows.

To create the **AWSServiceRoleForEC2Fleet** role for EC2 Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**, and then choose **Create role**.
3. For **Select type of trusted entity**, choose **AWS service**.
4. For **Choose the service that will use this role**, choose **EC2 - Fleet**, and then choose **Next: Permissions**, **Next: Tags**, and **Next: Review**.
5. On the **Review** page, choose **Create role**.

If you no longer need to use EC2 Fleet, we recommend that you delete the **AWSServiceRoleForEC2Fleet** role. After this role is deleted from your account, you can create the role again if you create another fleet.

For more information, see [Using service-linked roles](#) in the *IAM User Guide*.

Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots

If you specify an [encrypted AMI \(p. 193\)](#) or an [encrypted Amazon EBS snapshot \(p. 1921\)](#) in your EC2 Fleet and you use an AWS KMS key for encryption, you must grant the **AWSServiceRoleForEC2Fleet** role

permission to use the customer managed key so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the customer managed key, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see [Using grants](#) and [Using key policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

To grant the `AWSServiceRoleForEC2Fleet` role permissions to use the customer managed key

- Use the [create-grant](#) command to add a grant to the customer managed key and to specify the principal (the `AWSServiceRoleForEC2Fleet` service-linked role) that is given permission to perform the operations that the grant permits. The customer managed key is specified by the `key-id` parameter and the ARN of the customer managed key. The principal is specified by the `grantee-principal` parameter and the ARN of the `AWSServiceRoleForEC2Fleet` service-linked role.

```
aws kms create-grant \
    --region us-east-1 \
    --key-id arn:aws:kms:us-
east-1:44445556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2Fleet \
    --operations "Decrypt" "Encrypt" "GenerateDataKey"
    "GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"
    "ReEncryptTo"
```

Permissions for EC2 Fleet users

If your users will create or manage an EC2 Fleet, be sure to grant them the required permissions.

To create a policy for EC2 Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Policies**.
3. Choose **Create policy**.
4. On the **Create policy** page, choose the **JSON** tab, replace the text with the following, and choose **Review policy**.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam>ListRoles",
                "iam>PassRole",
                "iam>ListInstanceProfiles"
            ],
            "Resource": "arn:aws:iam::123456789012:role/DevTeam*"
        }
    ]
}
```

The `ec2:*` grants a user permission to call all Amazon EC2 API actions. To limit the user to specific Amazon EC2 API actions, specify those actions instead.

The user must have permission to call the `iam>ListRoles` action to enumerate existing IAM roles, the `iam:PassRole` action to specify the EC2 Fleet role, and the `iam>ListInstanceProfiles` action to enumerate existing instance profiles.

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must also add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
- `iam:AttachRolePolicy`
- `iam>CreateInstanceProfile`
- `iam>CreateRole`
- `iam:GetRole`
- `iam>ListPolicies`

5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
6. To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center (successor to AWS Single Sign-On):

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.

- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

EC2 Fleet health checks

EC2 Fleet checks the health status of the instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

EC2 Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as unhealthy when the status of either the instance status check or the system status check is impaired for three consecutive health status checks. For more information, see [Status checks for your instances \(p. 1153\)](#).

You can configure your fleet to replace unhealthy Spot Instances. After setting `ReplaceUnhealthyInstances` to `true`, a Spot Instance is replaced when it is reported as unhealthy. The fleet can go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for EC2 Fleets that maintain a target capacity (fleets of type `maintain`), and not for fleets of type `request` or `instant`.
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your EC2 Fleet to replace unhealthy instances only when you create it.

- Users can use health check replacement only if they have permission to call the ec2:DescribeInstanceStatus action.

To configure an EC2 Fleet to replace unhealthy Spot Instances

1. Follow the steps for creating an EC2 Fleet. For more information, see [Create an EC2 Fleet \(p. 1013\)](#).
2. To configure the fleet to replace unhealthy Spot Instances, in the JSON file, for ReplaceUnhealthyInstances, enter true.

Generate an EC2 Fleet JSON configuration file

To view the full list of EC2 Fleet configuration parameters, you can generate a JSON file. For a description of each parameter, see [create-fleet](#) in the AWS CLI Command Reference.

To generate a JSON file with all possible EC2 Fleet parameters using the command line

- Use the [create-fleet](#) (AWS CLI) command and the --generate-cli-skeleton parameter to generate an EC2 Fleet JSON file, and direct the output to a file to save it.

```
aws ec2 create-fleet \
    --generate-cli-skeleton input > ec2createfleet.json
```

Example output

```

Create an EC2 Fleet

To create an EC2 Fleet, you need only specify the following parameters:

- **LaunchTemplateId** or **LaunchTemplateName** – Specifies the launch template to use (which contains the parameters for the instances to launch, such as the instance type, Availability Zone, and the maximum price you're willing to pay)
- **TotalTargetCapacity** – Specifies the total target capacity for the fleet
- **DefaultTargetCapacityType** – Specifies whether the default purchasing option is On-Demand or Spot

You can specify multiple launch specifications that override the launch template. The launch specifications can vary by instance type, Availability Zone, subnet, and maximum price, and can include a different weighted capacity. Alternatively, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. For more information, see [Attribute-based instance type selection for EC2 Fleet \(p. 986\)](#).

If you do not specify a parameter, the fleet uses the default value for the parameter.

Specify the fleet parameters in a JSON file. For more information, see [Generate an EC2 Fleet JSON configuration file \(p. 1011\)](#).

There is currently no console support for creating an EC2 Fleet.

To create an EC2 Fleet (AWS CLI)

- Use the [create-fleet](#) (AWS CLI) command to create an EC2 Fleet and specify the JSON file that contains the fleet configuration parameters.

```
aws ec2 create-fleet --cli-input-json file://file_name.json
```

For example configuration files, see [EC2 Fleet example configurations \(p. 1106\)](#).

The following is example output for a fleet of type request or maintain.

```
{  
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"  
}
```

The following is example output for a fleet of type instant that launched the target capacity.

```
{  
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",  
    "Errors": [],  
    "Instances": [  
        {  
            "LaunchTemplateAndOverrides": {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateId": "lt-01234a567b8910abcEXAMPLE",  
                    "Version": "1"  
                },  
                "Overrides": {  
                    "InstanceType": "c5.large",  
                    "AvailabilityZone": "us-east-1a"  
                }  
            },

Tag an EC2 Fleet

To help categorize and manage your EC2 Fleet requests, you can tag them with custom metadata. You can assign a tag to an EC2 Fleet request when you create it, or afterward.

When you tag a fleet request, the instances and volumes that are launched by the fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the fleet. You can choose to assign tags to only the fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.

Note

For instant fleet types, you can tag volumes that are attached to On-Demand Instances and Spot Instances. For request or maintain fleet types, you can only tag volumes that are attached to On-Demand Instances.

For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

Prerequisite

Grant the user the permission to tag resources. For more information, see [Example: Tag resources \(p. 1631\)](#).

To grant a user the permission to tag resources

Create a IAM policy that includes the following:

- The ec2:CreateTags action. This grants the user permission to create tags.
- The ec2:CreateFleet action. This grants the user permission to create an EC2 Fleet request.
- For Resource, we recommend that you specify "*". This allows users to tag all resource types.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "TagEC2FleetRequest",
            "Effect": "Allow",
            "Action": "ec2:CreateTags",
            "Resource": "*"
        }
    ]
}
```

```
"Action": [  
    "ec2:CreateTags",  
    "ec2:CreateFleet"  
,  
    "Resource": "*"  
}
```

Important

We currently do not support resource-level permissions for the `create-fleet` resource. If you specify `create-fleet` as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how *not* to set the policy.

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags",  
        "ec2:CreateFleet"  
,  
        "Resource": "arn:aws:ec2:us-east-1:111122223333:create-fleet/*"  
    ]  
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center (successor to AWS Single Sign-On):

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.

- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

To tag a new EC2 Fleet request

To tag an EC2 Fleet request when you create it, specify the key-value pair in the [JSON file \(p. 1011\)](#) used to create the fleet. The value for `ResourceType` must be `fleet`. If you specify another value, the fleet request fails.

To tag instances and volumes launched by an EC2 Fleet

To tag instances and volumes when they are launched by the fleet, specify the tags in the [launch template \(p. 570\)](#) that is referenced in the EC2 Fleet request.

Note

You can't tag volumes attached to Spot Instances that are launched by a request or maintain fleet type.

To tag an existing EC2 Fleet request, instance, and volume (AWS CLI)

Use the [create-tags](#) command to tag existing resources.

```
aws ec2 create-tags \
```

```
--resources fleet-12a34b55-67cd-8ef9-  
ba9b-9208dEXAMPLE i-1234567890abcdef0 vol-1234567890EXAMPLE \  
--tags Key=purpose,Value=test
```

Describe your EC2 Fleet

You can describe your EC2 Fleet configuration, the instances in your EC2 Fleet, and the event history of your EC2 Fleet.

To describe your EC2 Fleets (AWS CLI)

Use the [describe-fleets](#) command to describe your EC2 Fleets.

```
aws ec2 describe-fleets
```

Important

If a fleet is of type `instant`, you must specify the fleet ID, otherwise it does not appear in the response. Include `--fleet-ids` as follows:

```
aws ec2 describe-fleets --fleet-ids fleet-8a22eeee4-f489-ab02-06b8-832a7EXAMPLE
```

Example output

```
{  
    "Fleets": [  
        {  
            "ActivityStatus": "fulfilled",  
            "CreateTime": "2022-02-09T03:35:52+00:00",  
            "FleetId": "fleet-364457cd-3a7a-4ed9-83d0-7b63e51bb1b7",  
            "FleetState": "active",  
            "ExcessCapacityTerminationPolicy": "termination",  
            "FulfilledCapacity": 2.0,  
            "FulfilledOnDemandCapacity": 0.0,  
            "LaunchTemplateConfigs": [  
                {  
                    "LaunchTemplateSpecification": {  
                        "LaunchTemplateName": "my-launch-template",  
                        "Version": "$Latest"  
                    }  
                }  
            ],  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "OnDemandTargetCapacity": 0,  
                "SpotTargetCapacity": 2,  
                "DefaultTargetCapacityType": "spot"  
            },  
            "TerminateInstancesWithExpiration": false,  
            "Type": "maintain",  
            "ReplaceUnhealthyInstances": false,  
            "SpotOptions": {  
                "AllocationStrategy": "capacity-optimized",  
                "InstanceInterruptionBehavior": "terminate"  
            },  
            "OnDemandOptions": {  
                "AllocationStrategy": "lowestPrice"  
            }  
        }  
    ]  
}
```

Use the [describe-fleet-instances](#) command to describe the instances for the specified EC2 Fleet. The returned list of running instances is refreshed periodically and might be out of date.

```
aws ec2 describe-fleet-instances --fleet-id fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Example output

```
{  
    "ActiveInstances": [  
        {  
            "InstanceId": "i-09cd595998cb3765e",  
            "InstanceHealth": "healthy",  
            "InstanceType": "m4.large",  
            "SpotInstanceRequestId": "sir-86k84j6p"  
        },  
        {  
            "InstanceId": "i-09cf95167ca219f17",  
            "InstanceHealth": "healthy",  
            "InstanceType": "m4.large",  
            "SpotInstanceRequestId": "sir-dvxi7fsm"  
        }  
    ],  
    "FleetId": "fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE"  
}
```

Use the [describe-fleet-history](#) command to describe the history for the specified EC2 Fleet for the specified time.

```
aws ec2 describe-fleet-history --fleet-id fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE --  
start-time 2018-04-10T00:00:00Z
```

Example output

```
{  
    "HistoryRecords": [  
        {  
            "EventInformation": {  
                "EventSubType": "submitted"  
            },  
            "EventType": "fleetRequestChange",  
            "Timestamp": "2020-09-01T18:26:05.000Z"  
        },  
        {  
            "EventInformation": {  
                "EventSubType": "active"  
            },  
            "EventType": "fleetRequestChange",  
            "Timestamp": "2020-09-01T18:26:15.000Z"

}
```

Modify an EC2 Fleet

You can modify an EC2 Fleet that is in the submitted or active state. When you modify a fleet, it enters the modifying state.

You can only modify an EC2 Fleet that is of type maintain. You cannot modify an EC2 Fleet of type request or instant.

You can modify the following parameters of an EC2 Fleet:

- **target-capacity-specification** – Increase or decrease the target capacity for TotalTargetCapacity, OnDemandTargetCapacity, and SpotTargetCapacity.
- **excess-capacity-termination-policy** – Whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the fleet. Valid values are no-termination and termination.

When you increase the target capacity, the EC2 Fleet launches the additional instances according to the instance purchasing option specified for DefaultTargetCapacityType, which are either On-Demand Instances or Spot Instances.

If the DefaultTargetCapacityType is spot, the EC2 Fleet launches the additional Spot Instances according to its allocation strategy. If the allocation strategy is lowest-price, the fleet launches the instances from the lowest priced Spot capacity pool in the request. If the allocation strategy is diversified, the fleet distributes the instances across the pools in the request.

When you decrease the target capacity, the EC2 Fleet deletes any open requests that exceed the new target capacity. You can request that the fleet terminate instances until the size of the fleet reaches the new target capacity. If the allocation strategy is lowest-price, the fleet terminates the instances with the highest price per unit. If the allocation strategy is diversified, the fleet terminates instances across the pools. Alternatively, you can request that EC2 Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or any instances that you terminate manually.

When an EC2 Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

To modify an EC2 Fleet (AWS CLI)

Use the [modify-fleet](#) command to update the target capacity of the specified EC2 Fleet.

```
aws ec2 modify-fleet \
```

```
--fleet-id fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity-specification TotalTargetCapacity=20
```

If you are decreasing the target capacity but want to keep the fleet at its current size, you can modify the previous command as follows.

```
aws ec2 modify-fleet \
--fleet-id fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity-specification TotalTargetCapacity=10 \
--excess-capacity-termination-policy no-termination
```

Delete an EC2 Fleet

If you no longer require an EC2 Fleet, you can delete it. After you delete a fleet, all Spot requests associated with the fleet are canceled, so that no new Spot Instances are launched.

When you delete an EC2 Fleet, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances.

If you specify that the instances must be terminated when the fleet is deleted, the fleet enters the deleted_terminating state. Otherwise, it enters the deleted_running state, and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

- You can delete up to 25 instant fleets in a single request. If you exceed this number, no instant fleets are deleted and an error is returned. There is no restriction on the number of fleets of type maintain or request that can be deleted in a single request.
- Up to 1000 instances can be terminated in a single request to delete instant fleets.

To delete an EC2 Fleet and terminate its instances (AWS CLI)

Use the [delete-fleets](#) command and the --terminate-instances parameter to delete the specified EC2 Fleet and terminate its associated instances.

```
aws ec2 delete-fleets \
--fleet-ids fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE \
--terminate-instances
```

Example output

```
{
    "UnsuccessfulFleetDeletions": [],
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_terminating",
            "PreviousFleetState": "active",
            "FleetId": "fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE"
        }
    ]
}
```

To delete an EC2 Fleet without terminating its instances (AWS CLI)

You can modify the previous command using the --no-terminate-instances parameter to delete the specified EC2 Fleet without terminating its associated instances.

Note

--no-terminate-instances is not supported for instant fleets.

```
aws ec2 delete-fleets \
--fleet-ids fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--no-terminate-instances
```

Example output

```
{
    "UnsuccessfulFleetDeletions": [],
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_running",
            "PreviousFleetState": "active",
            "FleetId": "fleet-4b8aaae8-dfb5-436d-a4c6-3dafa4c6b7dcEXAMPLE"
        }
    ]
}
```

Troubleshoot when a fleet fails to delete

If an EC2 Fleet fails to delete, UnsuccessfulFleetDeletions in the output returns the ID of the EC2 Fleet, an error code, and an error message.

The error codes are:

- ExceededInstantFleetNumForDeletion
- fleetIdDoesNotExist
- fleetIdMalformed
- fleetNotInDeletableState
- NoTerminateInstancesNotSupported
- UnauthorizedOperation
- unexpectedError

Troubleshooting ExceededInstantFleetNumForDeletion

If you try to delete more than 25 instant fleets in a single request, the ExceededInstantFleetNumForDeletion error is returned. The following is example output for this error.

```
{
    "UnsuccessfulFleetDeletions": [
        {
            "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
            "Error": {
                "Message": "Can't delete more than 25 instant fleets in a single request.",
                "Code": "ExceededInstantFleetNumForDeletion"
            }
        },
        {
            "FleetId": "fleet-9a941b23-0286-5bf4-2430-03a029a07e31",
            "Error": {
                "Message": "Can't delete more than 25 instant fleets in a single request.",
                "Code": "ExceededInstantFleetNumForDeletion"
            }
        }
    ]
}
```

```
        }
    .
    .
    ],
    "SuccessfulFleetDeletions": []
}
```

Troubleshoot NoTerminateInstancesNotSupported

If you specify that the instances in an instant fleet must not be terminated when you delete the fleet, the `NoTerminateInstancesNotSupported` error is returned. `--no-terminate-instances` is not supported for instant fleets. The following is example output for this error.

```
{
    "UnsuccessfulFleetDeletions": [
        {
            "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
            "Error": {
                "Message": "NoTerminateInstances option is not supported for instant fleet",
                "Code": "NoTerminateInstancesNotSupported"
            }
        ],
    "SuccessfulFleetDeletions": []
}
```

Troubleshoot UnauthorizedOperation

If you do not have permission to terminate instances, you get the `UnauthorizedOperation` error when deleting a fleet that must terminate its instances. The following is the error response.

```
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not authorized to perform this operation. Encoded authorization failure message: VvuncIxj7Z_CPGNYXWqnuFV-YjByeAU66Q9752NtQ-I3-qnDLWs6JLFdKnSMMiq5s6cGqjjPtEDpsnGHzzzyHasFH0aRYJpaDVravow25azn6KNkUQ01FwhJyujt2dtNCdduJfrqcFYAj1EiRMkfDht7N63SK1wBHTurzDK6A560Y2nDSUiMmAB1y9UntqaZJ9SNe5sNxKMqZaqKtjRbk02Rzu5V2vn9VMk6fm2aMVHbY9JhLvGypLcMUjtJ76H9ytg2zRVPiU5v2s-UgZ7h0p2yth6ysUdh10Ng6dBYu8_y_HtEI54invCj4CoK0qawqzMNe6rcmCQHvtCxtXsbkgyaEbcwmrm2m01-EMhekLFZeJLrDtYOpYcEl4_nWFX1wtQDCnNNCmxnJZAoJvb3VMDYpDTsxjQv1Px0DZuqWHS23YXWVyzgnLtHeRF2o41UhGBw17mXsS07k7XAfDPMP-PT9vrHtQiILor5VVTsjSPWg7edj_1rsnXhwPSu8gI48ZLRGrPQqFq0RmKO_QIE8N8s6NWzCK4yoX-9gDcheur0GpkpPIC9YPGMLKs</Message></Error></Errors><RequestId>89b1215c-7814-40ae-a8db-41761f43f2b0</RequestId></Response>
```

To resolve the error, you must add the `ec2:TerminateInstances` action to the IAM policy, as shown in the following example.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "DeleteFleetsAndTerminateInstances",
            "Effect": "Allow",
            "Action": [
                "ec2:DeleteFleets",
                "ec2:TerminateInstances"
            ],
            "Resource": "*"
        }
    ]
}
```

Spot Fleet

A Spot Fleet is a set of Spot Instances and optionally On-Demand Instances that is launched based on criteria that you specify. The Spot Fleet selects the Spot capacity pools that meet your needs and launches Spot Instances to meet the target capacity for the fleet. By default, Spot Fleets are set to *Maintain* target capacity by launching replacement instances after Spot Instances in the fleet are terminated. You can submit a Spot Fleet as a one-time *request*, which does not persist after the instances have been terminated. You can include On-Demand Instance requests in a Spot Fleet request.

Note

If you want to use a console to create a fleet that includes Spot Instances, we recommend using an Auto Scaling group rather than Spot Fleet. For more information, see [Get started with Amazon EC2 Auto Scaling](#) in the *Amazon EC2 Auto Scaling User Guide*.

If you want to use the AWS CLI to create a fleet that includes Spot Instances, we recommend using either an Auto Scaling group or EC2 Fleet rather than Spot Fleet. The [RequestSpotFleet](#) API, on which Spot Fleet is based, is a legacy API with no planned investment.

For more information about the recommended APIs to use, see [Which is the best Spot request method to use? \(p. 399\)](#)

Topics

- [Spot Fleet request types \(p. 1025\)](#)
- [Spot Fleet configuration strategies \(p. 1026\)](#)
- [Work with Spot Fleets \(p. 1050\)](#)
- [CloudWatch metrics for Spot Fleet \(p. 1071\)](#)
- [Automatic scaling for Spot Fleet \(p. 1073\)](#)

Spot Fleet request types

There are two types of Spot Fleet requests:

`request`

If you configure the request type as `request`, Spot Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

`maintain`

If you configure the request type as `maintain`, Spot Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

To specify the type of request in the Amazon EC2 console, do the following when creating a Spot Fleet request:

- To create a Spot Fleet of type `request`, clear the **Maintain target capacity** check box.
- To create a Spot Fleet of type `maintain`, select the **Maintain target capacity** check box.

For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#).

Both types of requests benefit from an allocation strategy. For more information, see [Allocation strategies for Spot Instances \(p. 1027\)](#).

Spot Fleet configuration strategies

A *Spot Fleet* is a collection, or fleet, of Spot Instances, and optionally On-Demand Instances.

The Spot Fleet attempts to launch the number of Spot Instances and On-Demand Instances to meet the target capacity that you specified in the Spot Fleet request. The request for Spot Instances is fulfilled if there is available capacity and the maximum price you specified in the request exceeds the current Spot price. The Spot Fleet also attempts to maintain its target capacity fleet if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and Spot Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

A *Spot capacity pool* is a set of unused EC2 instances with the same instance type (for example, m5.1large), operating system, Availability Zone, and network platform. When you make a Spot Fleet request, you can include multiple launch specifications, that vary by instance type, AMI, Availability Zone, or subnet. The Spot Fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your Spot Fleet request, and the configuration of the Spot Fleet request. The Spot Instances come from the selected pools.

Contents

- [Spot Fleet instance weighting \(p. 1048\)](#)

Plan a Spot Fleet request

Before you create a Spot Fleet request, review [Spot Best Practices](#). Use these best practices when you plan your Spot Fleet request so that you can provision the type of instances you want at the lowest possible price. We also recommend that you do the following:

- Determine whether you want to create a Spot Fleet that submits a one-time request for the desired target capacity, or one that maintains a target capacity over time.
- Determine the instance types that meet your application requirements.
- Determine the target capacity for your Spot Fleet request. You can set the target capacity in instances or in custom units. For more information, see [Spot Fleet instance weighting \(p. 1048\)](#).
- Determine what portion of the Spot Fleet target capacity must be On-Demand capacity. You can specify 0 for On-Demand capacity.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.
- Review the possible options for your Spot Fleet request. For more information, see the [request-spot-fleet](#) command in the *AWS CLI Command Reference*. For additional examples, see [Spot Fleet example configurations \(p. 1121\)](#).

Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which Spot Fleet can launch Spot Instances. However, when launching instances, Spot Fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

You can specify one of the following allocation strategies:

`priceCapacityOptimized` (recommended)

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. Spot Fleet then requests Spot Instances from the lowest priced of these pools.

The `priceCapacityOptimized` allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

`capacityOptimized`

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. You can optionally set a priority for each instance type in your fleet using `capacityOptimizedPrioritized`. Spot Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The `capacityOptimized` strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the `capacityOptimized` strategy can lower the overall cost of your workload.

Alternatively, you can use the `capacityOptimizedPrioritized` allocation strategy with a `priority` parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. Spot Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Using priorities is supported only if your fleet uses a launch template. Note that when you set the priority for `capacityOptimizedPrioritized`, the same priority is also applied to your On-Demand Instances if the `On-Demand Allocation Strategy` is set to `prioritized`.

`diversified`

The Spot Instances are distributed across all pools.

`lowestPrice`

The Spot Instances come from the lowest priced pool that has available capacity. This is the default strategy. However, we recommend that you override the default by specifying the `priceCapacityOptimized` allocation strategy.

If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity.

If a pool runs out of capacity before fulfilling your desired capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools.

Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

InstancePoolsToUseCount

The number of Spot pools across which to allocate your target Spot capacity. Valid only when the allocation strategy is set to `lowestPrice`. Spot Fleet selects the lowest priced Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that Spot Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Choose an appropriate allocation strategy

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy. For On-Demand Instance target capacity, Spot Fleet always selects the least expensive instance type based on the public On-Demand price, while following the allocation strategy—either `priceCapacityOptimized`, `capacityOptimized`, `diversified`, or `lowestPrice`—for Spot Instances.

Balance lowest price and capacity availability

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the `priceCapacityOptimized` allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term, while still taking price into consideration.

If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the `priceCapacityOptimized` allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point if they're interrupted. By using checkpointing, you make the `priceCapacityOptimized` allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For an example configuration that uses the `priceCapacityOptimized` allocation strategy, see [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 1118\)](#).

When workloads have a high cost of interruption

You can optionally use the `capacityOptimized` strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload. For an example configuration that uses the `capacityOptimized` allocation strategy, see [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances \(p. 1116\)](#).

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the `capacityOptimizedPrioritized` allocation strategy and then setting the order of instance types to use from highest to lowest

priority. For an example configuration, see [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 1117\)](#).

Note that using priorities is supported only if your fleet uses a launch template. Also note that when you set priorities for `capacityOptimizedPrioritized`, the same priorities are also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

When your workload is time flexible and capacity availability is not a factor

If your fleet is small or runs for a short time, you can use `priceCapacityOptimized` to maximize cost savings while still considering capacity availability.

If your workload is time flexible and capacity availability is not a factor, you can optionally use the `lowestPrice` allocation strategy to maximize cost savings. Note, however, that because the `lowestPrice` allocation strategy only considers instance price and not capacity availability, it might lead to high Spot Instance interruption rates.

When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the diversified strategy. For example, if your Spot Fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the diversified strategy, the Spot Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the [On-Demand price](#).

To create an inexpensive and diversified fleet, use the `lowestPrice` strategy in combination with `InstancePoolsToUseCount`. For example, if your target capacity is 10 Spot Instances, and you specify 2 Spot capacity pools (for `InstancePoolsToUseCount`), Spot Fleet will draw on the two lowest priced pools to fulfill your Spot capacity.

You can use a low or high number of Spot capacity pools across which to allocate your Spot Instances. For example, if you run batch processing, we recommend specifying a low number of Spot capacity pools (for example, `InstancePoolsToUseCount=2`) to ensure that your queue always has compute capacity while maximizing savings. If you run a web service, we recommend specifying a high number of Spot capacity pools (for example, `InstancePoolsToUseCount=10`) to minimize the impact if a Spot capacity pool becomes temporarily unavailable.

Note that Spot Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, a Spot Fleet of type `maintain` launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is `priceCapacityOptimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is `capacityOptimized`, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.

- If the allocation strategy is `diversified`, the fleet distributes the replacement Spot Instances across the remaining pools.
- If the allocation strategy is `lowestPrice`, the fleet launches replacement instances in the pool where the Spot price is currently the lowest.
- If the allocation strategy is `lowestPrice` in combination with `InstancePoolsToUseCount`, the fleet selects the Spot capacity pools with the lowest price and launches Spot Instances across the number of Spot capacity pools that you specify.

Attribute-based instance type selection for Spot Fleet

When you create a Spot Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as *attribute-based instance type selection*. For example, you can specify the minimum and maximum number of vCPUs required for your instances, and Spot Fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

Benefits

Attribute-based instance type selection has the following benefits:

- With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.
- To manually specify multiple instance types for a Spot Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.
- When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they're released, "future proofing" the fleet's configuration.
- When you specify instance attributes rather than instance types, Spot Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility \(p. 398\)](#).

Topics

- [How attribute-based instance type selection works \(p. 1030\)](#)
- [Considerations \(p. 1033\)](#)
- [Create a Spot Fleet with attribute-based instance type selection \(p. 1033\)](#)
- [Examples of configurations that are valid and not valid \(p. 1035\)](#)
- [Preview instance types with specified attributes \(p. 1041\)](#)

How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. Spot Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- [Types of instance attributes \(p. 1031\)](#)
- [Where to configure attribute-based instance type selection \(p. 1031\)](#)
- [How Spot Fleet uses attribute-based instance type selection when provisioning a fleet \(p. 1031\)](#)
- [Price protection \(p. 1032\)](#)

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements. For a description of each attribute and the default values, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in one or both of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and reference the launch template in the fleet request
- In a launch template override

If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- In a launch specification

How Spot Fleet uses attribute-based instance type selection when provisioning a fleet

Spot Fleet provisions a fleet in the following way:

- Spot Fleet identifies the instance types that have the specified attributes.
- Spot Fleet uses price protection to determine which instance types to exclude.
- Spot Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- Spot Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies. There might be a large number of instance types with the specified attributes, and some of them might be expensive. The default allocation strategy of `lowestPrice` for Spot and On-Demand guarantees that Spot Fleet will launch instances from the least expensive capacity pools.

If you specify an allocation strategy, Spot Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the `capacityOptimizedPrioritized`, `capacityOptimized` and `lowestPrice` allocation strategies.
- For On-Demand Instances, attribute-based instance type selection supports the `lowestPrice` allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

Price protection

Price protection is a feature that prevents your Spot Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. When you create a fleet with attribute-based instance type selection, price protection is enabled by default, with separate thresholds for On-Demand Instances and Spot Instances. When Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold. The thresholds represent the maximum you'll pay, expressed as a percentage above the least expensive current generation M, C, or R instance type with your specified attributes.

If you don't specify a threshold, the following thresholds are used by default:

- For On-Demand Instances, the price protection threshold is set at 20 percent.
- For Spot Instances, the price protection threshold is set at 100 percent.

To specify the price protection threshold

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

- Console

To specify the On-Demand Instance price protection threshold, under **Additional instance attribute**, choose **On-demand price protection**, and then choose **Add attribute**. For **On-Demand price protection percentage**, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, under **Additional instance attribute**, choose **Spot price protection**, and then choose **Add attribute**. For **Spot price protection percentage**, enter the price protection threshold as a percentage.

- AWS CLI

To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `OnDemandMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `SpotMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

For more information about creating the fleet, see [Create a Spot Fleet with attribute-based instance type selection \(p. 1033\)](#).

Note

When creating the Spot Fleet, if you set **Total target capacity** type to **vCPUs or Memory (MiB)** (console) or `TargetCapacityUnitType` to `vcpu` or `memory-mib` (AWS CLI), the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in a Spot Fleet, but not both at the same time.

When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of four `InstanceRequirements` structures in a request configuration.

Create a Spot Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the Amazon EC2 console or the AWS CLI.

Topics

- [Create a Spot Fleet using the console \(p. 1033\)](#)
- [Create a Spot Fleet using the AWS CLI \(p. 1033\)](#)

Create a Spot Fleet using the console

To configure a Spot Fleet for attribute-based instance type selection (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**, and then choose **Request Spot Instances**.
3. Follow the steps to create a Spot Fleet. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#).

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection as follows:

- a. For **Instance type requirements**, choose **Specify instance attributes that match your compute requirements**.
- b. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.
- c. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.
- d. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds further constraints to your request.
- e. (Optional) Expand **Preview matching instance types** to view the instance types that have your specified attributes.

Create a Spot Fleet using the AWS CLI

To configure a Spot Fleet for attribute-based instance type selection (AWS CLI)

Use the [request-spot-fleet](#) (AWS CLI) command to create a Spot Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 request-spot-fleet \
```

```
--region us-east-1 \
--spot-fleet-request-config file://file_name.json
```

Example *file_name.json* file

The following example contains the parameters that configure a Spot Fleet to use attribute-based instance type selection, and is followed by a text explanation.

```
{
    "AllocationStrategy": "priceCapacityOptimized",
    "TargetCapacity": 20,
    "Type": "request",
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 2
                        },
                        "MemoryMiB": {
                            "Min": 4
                        }
                    }
                }
            ]
        }
    ]
}
```

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. In this example, two attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [Spot Fleet provisions the fleet \(p. 1031\)](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Note

When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

The JSON also contains the following fleet configuration:

- `"AllocationStrategy": "priceCapacityOptimized"` – The allocation strategy for the Spot Instances in the fleet.
- `"LaunchTemplateName": "my-launch-template", "Version": "1"` – The launch template contains some instance configuration information, but if any instance types are specified, they will be overridden by the attributes that are specified in `InstanceRequirements`.
- `"TargetCapacity": 20` – The target capacity is 20 instances.
- `"Type": "request"` – The request type for the fleet is `request`.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create a Spot Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- [Valid configuration: Single launch template with overrides \(p. 1035\)](#)
- [Valid configuration: Single launch template with multiple InstanceRequirements \(p. 1036\)](#)
- [Valid configuration: Two launch templates, each with overrides \(p. 1037\)](#)
- [Valid configuration: Only InstanceRequirements specified, no overlapping attribute values \(p. 1038\)](#)
- [Configuration not valid: Overrides contain InstanceRequirements and InstanceType \(p. 1039\)](#)
- [Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType \(p. 1039\)](#)
- [Configuration not valid: Overlapping attribute values \(p. 1040\)](#)

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one `Overrides` structure containing one `InstanceRequirements` structure. A text explanation of the example configuration follows.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IAMFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "My-launch-template",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 2,  
                                "Max": 8  
                            },  
                            "MemoryMib": {  
                                "Min": 0,  
                                "Max": 10240  
                            },  
                            "MemoryGiBPerVCpu": {  
                                "Max": 10000  
                            },  
                            "RequireHibernateSupport": true  
                        }  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        ],
        "TargetCapacity": 5000,
        "OnDemandTargetCapacity": 0,
        "TargetCapacityUnitType": "vcpu"
    }
}
```

InstanceRequirements

To use attribute-based instance selection, you must include the `InstanceRequirements` structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- `VCpuCount` – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- `MemoryMiB` – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- `MemoryGiBPerVCpu` – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The `Min` parameter is optional. By omitting it, you indicate no minimum limit.

TargetCapacityUnitType

The `TargetCapacityUnitType` parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is `vcpu`, which together specify a desired target capacity of 5,000 vCPUs. Spot Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one `Overrides` structure containing two `InstanceRequirements` structures. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    },
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 4,
                                "Max": 8
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        ],
        "InstanceRequirements": {
            "VCpuCount": {
                "Min": 0,
                "Max": 8
            },
            "MemoryMiB": {
                "Min": 0
            }
        }
    }
}
```

```
        "VCpuCount": {
            "Min": 4,
            "Max": 8
        },
        "MemoryMiB": {
            "Min": 0
        }
    }
],
"TargetCapacity": 1,
"OnDemandTargetCapacity": 0,
"Type": "maintain"
}
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one Overrides structure containing one InstanceRequirements structure. This configuration is useful for arm and x86 architecture support in the same fleet.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "armLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    },
                    {
                        "LaunchTemplateSpecification": {
                            "LaunchTemplateName": "x86LaunchTemplate",
                            "Version": "1"
                        },
                        "Overrides": [
                            {
                                "InstanceRequirements": {
                                    "VCpuCount": {
                                        "Min": 0,
                                        "Max": 2
                                    },
                                    "MemoryMiB": {
                                        "Min": 0
                                    }
                                }
                            }
                        ]
                    }
                ]
            }
        ]
    }
}
```

```
        ],
    ],
    "TargetCapacity": 1,
    "OnDemandTargetCapacity": 0,
    "Type": "maintain"
}
}
```

Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two LaunchTemplateSpecification structures, each with a launch template and an Overrides structure containing an InstanceRequirements structure. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VCpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IAMFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 4,
                                "Max": 8
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
    }
}
```

```
        "Type": "maintain"  
    }  
}
```

Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "MyLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    },  
                    {  
                        "InstanceType": "m5.large"  
                    }  
                ]  
            }  
        ],  
        "TargetCapacity": 1,  
        "OnDemandTargetCapacity": 0,  
        "Type": "maintain"  
    }  
}
```

Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "MyLaunchTemplate",  
                    "Version": "1"  
                }  
            }  
        ]  
    }  
}
```

```
        },
        "Overrides": [
        {
            "InstanceRequirements": {
                "VCpuCount": {
                    "Min": 0,
                    "Max": 2
                },
                "MemoryMiB": {
                    "Min": 0
                }
            }
        }
    ],
    "LaunchTemplateSpecification": {
        "LaunchTemplateName": "MyOtherLaunchTemplate",
        "Version": "1"
    },
    "Overrides": [
    {
        "InstanceType": "m5.large"
    }
]
},
"TargetCapacity": 1,
"OnDemandTargetCapacity": 0,
"Type": "maintain"
}
}
```

Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two `InstanceRequirements` structures each contain `"VCpuCount": {"Min": 0, "Max": 2}`. The values for these attributes overlap, which will result in duplicate capacity pools.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IAMFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                },
                {
                    "InstanceRequirements": {
                        "VCpuCount": {

}
```

Preview instance types with specified attributes

You can use the [get-instance-types-from-instance-requirements](#) AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the [get-instance-types-from-instance-requirements](#) command and the --generate-cli-skeleton parameter. You can optionally direct the output to a file to save it by using input > *attributes.json*.

```
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json
```

Expected output

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "i386"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },

    },
    "MaxResults": 0,
    "NextToken": ""
}
```

2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

Note

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

For a description of each attribute and their default values, see [get-instance-types-from-instance-requirements](#) in the *Amazon EC2 Command Line Reference*.

- a. For `ArchitectureTypes`, specify one or more types of processor architecture.

- b. For `VirtualizationTypes`, specify one or more types of virtualization.
 - c. For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - d. For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.
 - e. You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.
3. To preview the instance types that have the attributes that you specified in the JSON file, use the [get-instance-types-from-instance-requirements](#) command, and specify the name and path to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

Example *attributes.json* file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{  
    "ArchitectureTypes": [  
        "x86_64"  
    ],  
    "VirtualizationTypes": [  
        "hvm"  
    ],  
    "InstanceRequirements": {  
        "VCpuCount": {  
            "Min": 4,  
            "Max": 6  
        },  
        "MemoryMiB": {  
            "Min": 2048  
        },  
        "InstanceGenerations": [  
            "current"  
        ]  
    }  
}
```

Example output

```
-----  
|GetInstanceTypesFromInstanceRequirements|  
+-----+  
||      InstanceTypes      ||  
+-----+

```

|| c6a.xlarge
...
||

4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

On-Demand in Spot Fleet

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. In your Spot Fleet request, you specify your desired target capacity and how much of that capacity must be On-Demand. The balance comprises Spot capacity, which is launched if there is available Amazon EC2 capacity and availability. For example, if in your Spot Fleet request you specify the target capacity as 10 and the On-Demand capacity as 8, Amazon EC2 launches 8 capacity units as On-Demand, and 2 capacity units ($10-8=2$) as Spot.

Prioritize instance types for On-Demand capacity

When Spot Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If `OnDemandAllocationStrategy` is set to `prioritized`, Spot Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity.

The priority is assigned to the launch template override, and the highest priority is launched first.

Example: Prioritize instance types

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the cheapest instance type:

- m4.large – cheapest
- m5.large
- m5a.large

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the cheapest instance type.

However, say you have unused m5.large Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

- m5.large – priority 1
- m4.large – priority 2
- m5a.large – priority 3

Capacity Rebalancing

You can configure Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see [EC2 instance rebalance recommendations \(p. 429\)](#).

To configure Spot Fleet to launch a replacement Spot Instance, you can use the Amazon EC2 console or the AWS CLI.

- Amazon EC2 console: You must select the **Capacity rebalance** check box when you create the Spot Fleet. For more information, see step 6.d. in [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#).
- AWS CLI: Use the `request-spot-fleet` command and the relevant parameters in the `SpotMaintenanceStrategies` structure. For more information, see the [example launch configuration \(p. 1129\)](#).

Limitations

- Capacity Rebalancing is available only for fleets of type `maintain`.
- When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The `ReplacementStrategy` for Spot Fleet supports the following two values:

`launch-before-terminate`

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify `launch-before-terminate`, you must also specify a value for `termination-delay`. After the new replacement instances are launched, Amazon EC2 waits for the duration of the `termination-delay`, and then terminates the old instances. For `termination-delay`, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the `termination-delay`.

We strongly recommend against using the `lowestPrice` allocation strategy in combination with `launch-before-terminate` to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

`launch`

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure a Spot Fleet for Capacity Rebalancing, consider the following:

Provide as many Spot capacity pools in the request as possible

Configure your Spot Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see [Be flexible about instance types and Availability Zones \(p. 398\)](#).

Avoid an elevated risk of interruption of replacement Spot Instances

Your replacement Spot Instances may be at an elevated risk of interruption if you use the `lowestPrice` allocation strategy. This is because Amazon EC2 will always launch instances in the lowest priced pool that has available capacity at that moment, even if your replacement Spot

Instances are likely to be interrupted soon after being launched. To avoid an elevated risk of interruption, we strongly recommend against using the `lowestPrice` allocation strategy, and instead recommend the `capacityOptimized` or `capacityOptimizedPrioritized` allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see [Use the price and capacity optimized allocation strategy \(p. 398\)](#).

Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your [Spot Instance interruption rate \(p. 433\)](#) (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you'd waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances are interrupted. With a [Spot Instance interruption notice \(p. 440\)](#), you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing's proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- 2:00 PM – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- 2:30 PM – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
- 2:32 PM – If Capacity Rebalancing wasn't enabled, and if a Spot Instance interruption notice would've been received at 2:32 PM for instance-A, you would only have had up to two minutes to take action, but Instance-A would have been running up till this time.

* If `launch-before-terminate` is specified, Amazon EC2 will terminate the at-risk instance after the replacement instance comes online.

Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target capacity

When a Spot Fleet is configured for Capacity Rebalancing, Amazon EC2 attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of the fulfilled capacity. Depending on the replacement strategy, Amazon EC2 either terminates the instance after

a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform [rebalancing actions \(p. 430\)](#) on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance recommendation, but no more replacement instances are launched because the fleet cannot exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

We recommend that you configure Spot Fleet to terminate Spot Instances that receive a rebalance recommendation

If you configure your Spot Fleet for Capacity Rebasing, we recommend that you choose launch-before-terminate with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform [rebalancing actions \(p. 430\)](#) on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see [Monitor rebalance recommendation signals \(p. 430\)](#).

Spot Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out

If your Spot Fleet is configured for Capacity Rebasing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- Scale in – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.

- Scale out – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

Spot price overrides

Each Spot Fleet request can include a global maximum price, or use the default (the On-Demand price). Spot Fleet uses this as the default maximum price for each of its launch specifications.

You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the Spot Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

Control spending

Spot Fleet stops launching instances when it has either reached the target capacity or the maximum amount you're willing to pay. To control the amount you pay per hour for your fleet, you can specify the `SpotMaxTotalPrice` for Spot Instances and the `OnDemandMaxTotalPrice` for On-Demand Instances. When the maximum total price is reached, Spot Fleet stops launching instances even if it hasn't met the target capacity.

The following examples show two different scenarios. In the first, Spot Fleet stops launching instances when it has met the target capacity. In the second, Spot Fleet stops launching instances when it has reached the maximum amount you're willing to pay.

Example: Stop launching instances when target capacity is reached

Given a request for `m4.1large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `OnDemandMaxTotalPrice`: \$1.50

Spot Fleet launches 10 On-Demand Instances because the total of \$1.00 (10 instances x \$0.10) does not exceed the `OnDemandMaxTotalPrice` of \$1.50.

Example: Stop launching instances when maximum total price is reached

Given a request for `m4.1large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `OnDemandMaxTotalPrice`: \$0.80

If Spot Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be \$1.00. This is more than the amount (\$0.80) specified for `OnDemandMaxTotalPrice`. To prevent spending more than you're willing to pay, Spot Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the `OnDemandMaxTotalPrice`.

Spot Fleet instance weighting

When you request a fleet of Spot Instances, you can define the capacity units that each instance type would contribute to your application's performance, and adjust your maximum price for each Spot capacity pool accordingly using *instance weighting*.

By default, the price that you specify is *per instance hour*. When you use the instance weighting feature, the price that you specify is *per unit hour*. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an

integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. Spot Fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following tables provide examples of calculations to determine the price per unit for a Spot Fleet request with a target capacity of 10.

Instance type	Instance weight	Price per instance hour	Price per unit hour	Number of instances launched
r3.xlarge	2	\$0.05	.025 (.05 divided by 2)	5 (10 divided by 2)

Instance type	Instance weight	Price per instance hour	Price per unit hour	Number of instances launched
r3.8xlarge	8	\$0.10	.0125 (.10 divided by 8)	2 (10 divided by 8, result rounded up)

Use Spot Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your Spot Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch configuration, specify the weight, which is the number of units that the instance type represents toward the target capacity.

Instance weighting example

Consider a Spot Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type r3.2xlarge and a weight of 6
- A launch specification with an instance type c3.xlarge and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for r3.2xlarge per instance hour divided by 6), the Spot Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for c3.xlarge per instance hour divided by 5), the Spot Fleet would launch five of these instances (24 divided by 5, result rounded up).

Instance weighting and allocation strategy

Consider a Spot Fleet request with the following configuration:

- A target capacity of 30
- A launch specification with an instance type c3.2xlarge and a weight of 8

- A launch specification with an instance type `m3.xlarge` and a weight of 8
- A launch specification with an instance type `r3.xlarge` and a weight of 8

The Spot Fleet would launch four instances (30 divided by 8, result rounded up). With the `lowestPrice` strategy, all four instances come from the pool that provides the lowest price per unit. With the diversified strategy, the Spot Fleet launches one instance in each of the three pools, and the fourth instance in whichever pool provides the lowest price per unit.

Work with Spot Fleets

To start using a Spot Fleet, you create a Spot Fleet request that includes the target capacity, an optional On-Demand portion, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch specification that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

It is not possible to modify the target capacity of a one-time request after it's been submitted. To change the target capacity, cancel the request and submit a new one.

A Spot Fleet request remains active until it expires or you cancel it. When you cancel a fleet request, you can specify whether canceling the request terminates the Spot Instances in that fleet.

Contents

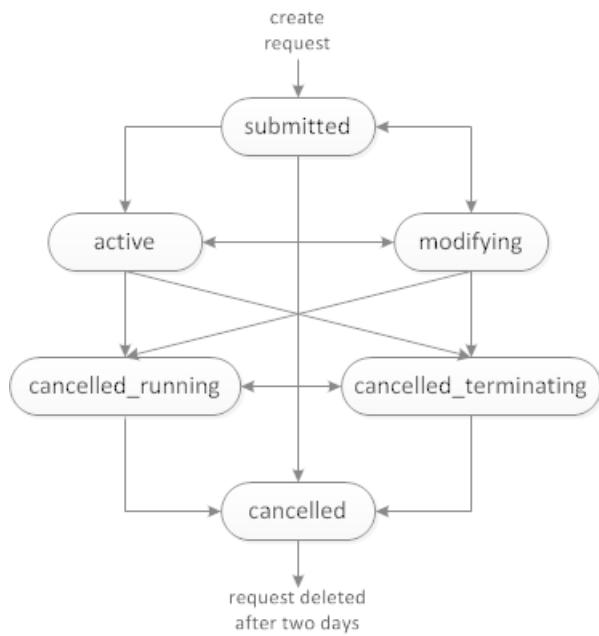

- [Spot Fleet request states \(p. 1050\)](#)
- [Spot Fleet health checks \(p. 1051\)](#)
- [Spot Fleet permissions \(p. 1052\)](#)

- [Cancel a Spot Fleet request \(p. 1070\)](#)

Spot Fleet request states

A Spot Fleet request can be in one of the following states:

- `submitted` – The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.
- `active` – The Spot Fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot Instances. The request remains in this state until it is modified or canceled.
- `modifying` – The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed or the Spot Fleet is canceled. A one-time request cannot be modified, and this state does not apply to such Spot requests.
- `cancelled_running` – The Spot Fleet is canceled and does not launch additional Spot Instances. Its existing Spot Instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.
- `cancelled_terminating` – The Spot Fleet is canceled and its Spot Instances are terminating. The request remains in this state until all instances are terminated.
- `cancelled` – The Spot Fleet is canceled and has no running Spot Instances. The Spot Fleet request is deleted two days after its instances were terminated.

The following illustration represents the transitions between the request states. If you exceed your Spot Fleet limits, the request is canceled immediately.

Spot Fleet health checks

Spot Fleet checks the health status of the Spot Instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

Spot Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as unhealthy when the status of either the instance status check or the system status check is impaired for three consecutive health checks. For more information, see [Status checks for your instances \(p. 1153\)](#).

You can configure your fleet to replace unhealthy Spot Instances. After enabling health check replacement, a Spot Instance is replaced when it is reported as unhealthy. The fleet could go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for Spot Fleets that maintain a target capacity (fleets of type `maintain`), not for one-time Spot Fleets (fleets of type `request`).
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your Spot Fleet to replace unhealthy instances only when you create it.
- Users can use health check replacement only if they have permission to call the `ec2:DescribeInstanceStatus` action.

Console

To configure a Spot Fleet to replace unhealthy Spot Instances using the console

1. Follow the steps for creating a Spot Fleet. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#).
2. To configure the fleet to replace unhealthy Spot Instances, for **Health check**, choose **Replace unhealthy instances**. To enable this option, you must first choose **Maintain target capacity**.

AWS CLI

To configure a Spot Fleet to replace unhealthy Spot Instances using the AWS CLI

1. Follow the steps for creating a Spot Fleet. For more information, see [Create a Spot Fleet using the AWS CLI \(p. 1061\)](#).
2. To configure the fleet to replace unhealthy Spot Instances, for ReplaceUnhealthyInstances, enter true.

Spot Fleet permissions

If your users will create or manage a Spot Fleet, you need to grant them the required permissions.

If you use the Amazon EC2 console to create a Spot Fleet, it creates two service-linked roles named AWSServiceRoleForEC2SpotFleet and AWSServiceRoleForEC2Spot, and a role named aws-ec2-spot-fleet-tagging-role that grant the Spot Fleet the permissions to request, launch, terminate, and tag resources on your behalf. If you use the AWS CLI or an API, you must ensure that these roles exist.

Use the following instructions to grant the required permissions and create the roles.

Permissions and roles

- [Grant permission to users for Spot Fleet \(p. 1052\)](#)
- [Service-linked role for Spot Fleet \(p. 1054\)](#)
- [Service-linked role for Spot Instances \(p. 1056\)](#)
- [IAM role for tagging a Spot Fleet \(p. 1056\)](#)

Grant permission to users for Spot Fleet

If your users will create or manage a Spot Fleet, be sure to grant them the required permissions.

To create a policy for Spot Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Policies**, **Create policy**.
3. On the **Create policy** page, choose **JSON**, and replace the text with the following.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances",  
                "ec2:CreateTags",  
                "ec2:RequestSpotFleet",  
                "ec2:ModifySpotFleetRequest",  
                "ec2:CancelSpotFleetRequests",  
                "ec2:DescribeSpotFleetRequests",  
                "ec2:DescribeSpotFleetInstances",  
                "ec2:DescribeSpotFleetRequestHistory"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "arn:aws:iam::aws:policy/AmazonEC2SPotFleetRole"  
        }  
    ]  
}
```

```
        "Resource": "arn:aws:iam::*:role/aws-ec2-spot-fleet-tagging-role"
    },
{
    "Effect": "Allow",
    "Action": [
        "iam:CreateServiceLinkedRole",
        "iam>ListRoles",
        "iam>ListInstanceProfiles"
    ],
    "Resource": "*"
}
]
```

The preceding example policy grants a user the permissions required for most Spot Fleet use cases. To limit the user to specific API actions, specify only those API actions instead.

Required EC2 and IAM APIs

The following APIs must be included in the policy:

- `ec2:RunInstances` – Required to launch instances in a Spot Fleet
- `ec2>CreateTags` – Required to tag the Spot Fleet request, instances, or volumes
- `iam:PassRole` – Required to specify the Spot Fleet role
- `iam:CreateServiceLinkedRole` – Required to create the service-linked role
- `iam>ListRoles` – Required to enumerate existing IAM roles
- `iam>ListInstanceProfiles` – Required to enumerate existing instance profiles

Important

If you specify a role for the IAM instance profile in the launch specification or launch template, you must grant the user the permission to pass the role to the service. To do this, in the IAM policy include "arn:aws:iam::*:role/*IamInstanceProfile-role*" as a resource for the `iam:PassRole` action. For more information, see [Granting a user permissions to pass a role to an AWS service](#) in the *IAM User Guide*.

Spot Fleet APIs

Add the following Spot Fleet API actions to your policy, as needed:

- `ec2:RequestSpotFleet`
- `ec2:ModifySpotFleetRequest`
- `ec2:CancelSpotFleetRequests`
- `ec2:DescribeSpotFleetRequests`
- `ec2:DescribeSpotFleetInstances`
- `ec2:DescribeSpotFleetRequestHistory`

Optional IAM APIs

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
- `iam:AttachRolePolicy`
- `iam>CreateInstanceProfile`
- `iam>CreateRole`

- iam:GetRole
 - iam>ListPolicies
4. Choose **Review policy**.
5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
6. To provide access, add permissions to your users, groups, or roles:
- Users and groups in AWS IAM Identity Center (successor to AWS Single Sign-On):

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide*.
 - Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.
 - IAM users:
 - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
 - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Service-linked role for Spot Fleet

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS service. Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information, see [Using Service-Linked Roles](#) in the *IAM User Guide*.

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2SpotFleet** to launch and manage instances on your behalf.

Important

If you specify an [encrypted AMI \(p. 193\)](#) or an [encrypted Amazon EBS snapshot \(p. 1921\)](#) in your Spot Fleet, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. For more information, see [Grant access to CMKs for use with encrypted AMIs and EBS snapshots \(p. 1055\)](#).

Permissions granted by AWSServiceRoleForEC2SpotFleet

Amazon EC2 uses **AWSServiceRoleForEC2SpotFleet** to complete the following actions:

- ec2:RequestSpotInstances - Request Spot Instances
- ec2:RunInstances - Launch instances
- ec2:TerminateInstances - Terminate instances
- ec2:DescribeImages - Describe Amazon Machine Images (AMIs) for the instances
- ec2:DescribeInstanceStatus - Describe the status of the instances
- ec2:DescribeSubnets - Describe the subnets for the instances
- ec2:CreateTags - Add tags to the Spot Fleet request, instances, and volumes
- elasticloadbalancing:RegisterInstancesWithLoadBalancer - Add the specified instances to the specified load balancer
- elasticloadbalancing:RegisterTargets - Register the specified targets with the specified target group

Create the service-linked role

Under most circumstances, you don't need to manually create a service-linked role. Amazon EC2 creates the **AWSServiceRoleForEC2SpotFleet** service-linked role the first time you create a Spot Fleet using the console.

If you had an active Spot Fleet request before October 2017, when Amazon EC2 began supporting this service-linked role, Amazon EC2 created the **AWSServiceRoleForEC2SpotFleet** role in your AWS account. For more information, see [A new role appeared in my AWS account](#) in the *IAM User Guide*.

If you use the AWS CLI or an API to create a Spot Fleet, you must first ensure that this role exists.

To create AWSServiceRoleForEC2SpotFleet using the console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. For **Select type of trusted entity**, choose **AWS service**.
5. Under **Choose a use case, Or select a service to view its use cases**, choose **EC2**.
6. Under **Select your use case**, choose **EC2 - Spot Fleet**.
7. Choose **Next: Permissions**.
8. On the next page, choose **Next: Tags**.
9. On the next page, choose **Next: Review**.
10. On the **Review** page, choose **Create role**.

To create AWSServiceRoleForEC2SpotFleet using the AWS CLI

Use the [create-service-linked-role](#) command as follows.

```
aws iam create-service-linked-role --aws-service-name spotfleet.amazonaws.com
```

If you no longer need to use Spot Fleet, we recommend that you delete the **AWSServiceRoleForEC2SpotFleet** role. After this role is deleted from your account, Amazon EC2 will create the role again if you request a Spot Fleet using the console. For more information, see [Deleting a Service-Linked Role](#) in the *IAM User Guide*.

Grant access to CMKs for use with encrypted AMIs and EBS snapshots

If you specify an [encrypted AMI \(p. 193\)](#) or an [encrypted Amazon EBS snapshot \(p. 1921\)](#) in your Spot Fleet request and you use a customer managed customer master key (CMK) for encryption, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the CMK, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see [Using Grants](#) and [Using Key Policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

To grant the AWSServiceRoleForEC2SpotFleet role permissions to use the CMK

- Use the [create-grant](#) command to add a grant to the CMK and to specify the principal (the **AWSServiceRoleForEC2SpotFleet** service-linked role) that is given permission to perform the operations that the grant permits. The CMK is specified by the `key-id` parameter and the ARN of the CMK. The principal is specified by the `grantee-principal` parameter and the ARN of the **AWSServiceRoleForEC2SpotFleet** service-linked role.

```
aws kms create-grant \
    --region us-east-1 \
    --key-id arn:aws:kms:us-
east-1:44445556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2SpotFleet \
    --operations "Decrypt" "Encrypt" "GenerateDataKey"
"GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"
"ReEncryptTo"
```

Service-linked role for Spot Instances

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2Spot** to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests \(p. 406\)](#).

IAM role for tagging a Spot Fleet

The `aws-ec2-spot-fleet-tagging-role` IAM role grants the Spot Fleet permission to tag the Spot Fleet request, instances, and volumes. For more information, see [Tag a Spot Fleet \(p. 1062\)](#).

Important

If you choose to tag instances in the fleet and you also choose to maintain target capacity (the Spot Fleet request is of type `maintain`), the differences in the permissions that are set for the user and the `IamFleetRole` might lead to inconsistent tagging behavior of instances in the fleet. If the `IamFleetRole` does not include the `CreateTags` permission, some of the instances launched by the fleet might not be tagged. While we are working to fix this inconsistency, to ensure that all instances launched by the fleet are tagged, we recommend that you use the `aws-ec2-spot-fleet-tagging-role` role for the `IamFleetRole`. Alternatively, to use an existing role, attach the `AmazonEC2SpotFleetTaggingRole` AWS Managed Policy to the existing role. Otherwise, you need to manually add the `CreateTags` permission to your existing policy.

To create the IAM role for tagging a Spot Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. On the **Select trusted entity** page, under **Trusted entity type**, choose **AWS service**.
5. Under **Use case**, from **Use cases for other AWS services**, choose **EC2**, and then choose **EC2 - Spot Fleet Tagging**.
6. Choose **Next**.
7. On the **Add permissions** page, choose **Next**.
8. On the **Name, review, and create** page, for **Role name**, enter a name for the role (for example, `aws-ec2-spot-fleet-tagging-role`).
9. Review the information on the page, and then choose **Create role**.

Cross-service confused deputy prevention

The [confused deputy problem](#) is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. We recommend that you use the `aws:SourceArn` and `aws:SourceAccount` global condition context keys in the `aws-ec2-spot-fleet-tagging-role` trust policy to limit the permissions that Spot Fleet gives another service to the resource.

To add the aws:SourceArn and aws:SourceAccount condition keys to the aws-ec2-spot-fleet-tagging-role trust policy

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.
3. Find the aws-ec2-spot-fleet-tagging-role that you created previously and choose the link (not the check box).
4. Under **Summary**, choose the **Trust relationships** tab, and then choose **Edit trust policy**.
5. In the JSON statement, add a Condition element containing your aws:SourceAccount and aws:SourceArn global condition context keys to prevent the [confused deputy problem](#), as follows:

```
"Condition": {
    "ArnLike": {
        "aws:SourceArn": "arn:aws:ec2:us-east-1:account_id:spot-fleet-request/sfr-*"
    },
    "StringEquals": {
        "aws:SourceAccount": "account_id"
    }
}
```

Note

If the aws:SourceArn value contains the account ID and you use both global condition context keys, the aws:SourceAccount value and the account in the aws:SourceArn value must use the same account ID when used in the same policy statement.

The final trust policy will be as follows:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "ConfusedDeputyPreventionExamplePolicy",
            "Effect": "Allow",
            "Principal": {
                "Service": "spotfleet.amazonaws.com"
            },
            "Action": "sts:AssumeRole",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:ec2:us-east-1:account_id:spot-fleet-request/sfr-*"
                },
                "StringEquals": {
                    "aws:SourceAccount": "account_id"
                }
            }
        }
    ]
}
```

6. Choose **Update policy**.

The following table provides potential values for aws:SourceArn to limit the scope of the your aws-ec2-spot-fleet-tagging-role in varying degrees of specificity.

API operation	Called service	Scope	aws:SourceArn
RequestSpotFleet	AWS STS (AssumeRole)	Limit the AssumeRole capability on aws-ec2-spot-fleet-tagging-role to	arn:aws:ec2:*:123456789012:spot-fleet-request/sfr-*

API operation	Called service	Scope	aws:SourceArn
		spot-fleet-requests in the specified account.	
RequestSpotFleet	AWS STS (AssumeRole)	Limit the AssumeRole capability on aws-ec2-spot-fleet-tagging-role to spot-fleet-requests in the specified account and specified Region. Note that this role will not be usable in other Regions.	arn:aws:ec2: <i>us-east-1:123456789012</i> :spot-fleet-request/sfr-*
RequestSpotFleet	AWS STS (AssumeRole)	Limit the AssumeRole capability on aws-ec2-spot-fleet-tagging-role to only actions affecting the fleet sfr-11111111-1111-1111-1111-111111111111. Note that this role may not be usable for other Spot Fleets. Also, this role cannot be used to launch any new Spot Fleets through request-spot-fleet.	arn:aws:ec2: <i>us-east-1:123456789012</i> :spot-fleet-request/sfr- <i>11111111-1111-1111-1111-111111111111</i> .

Create a Spot Fleet request

Using the AWS Management Console, quickly create a Spot Fleet request by choosing only your application or task need and minimum compute specs. Amazon EC2 configures a fleet that best meets your needs and follows Spot best practice. For more information, see [Quickly create a Spot Fleet request \(console\) \(p. 1058\)](#). Otherwise, you can modify any of the default settings. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#) and [Create a Spot Fleet using the AWS CLI \(p. 1061\)](#).

Options for creating a Spot Fleet

- [Quickly create a Spot Fleet request \(console\) \(p. 1058\)](#)
- [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#)
- [Create a Spot Fleet using the AWS CLI \(p. 1061\)](#)

Quickly create a Spot Fleet request (console)

Follow these steps to quickly create a Spot Fleet request.

To create a Spot Fleet request using the recommended settings (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Request Spot Instances**.

4. Under **Launch parameters**, choose **Manually configure launch parameters**.
5. For **AMI**, choose an AMI.
6. Under **Target capacity**, for **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**.
7. For **Your fleet request at a glance**, review your fleet configuration, and choose **Launch**.

Create a Spot Fleet request using defined parameters (console)

You can create a Spot Fleet by using parameters that you define.

To create a Spot Fleet request using defined parameters (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Request Spot Instances**.
4. For **Launch parameters**, do the following:
 - a. To define the launch parameters in the Spot console, choose **Manually configure launch parameters**.
 - b. For **AMI**, choose one of the basic AMIs provided by AWS, or choose **Search for AMI** to use an AMI from our user community, the AWS Marketplace, or one of your own.
 - c. (Optional) For **Key pair name**, choose an existing key pair or create a new one.

[Existing key pair] Choose the key pair.

[New key pair] Choose **Create new key pair** to go the **Key Pairs** page. When you are done, return to the **Spot Requests** page and refresh the list.
 - d. (Optional) Expand **Additional launch parameters**, and do the following:
 - i. (Optional) To enable Amazon EBS optimization, for **EBS-optimized**, select **Launch EBS-optimized instances**.
 - ii. (Optional) To add temporary block-level storage for your instances, for **Instance store**, choose **Attach at launch**.
 - iii. (Optional) To add storage, choose **Add new volume**, and specify additional instance store volumes or Amazon EBS volumes, depending on the instance type.
 - iv. (Optional) By default, basic monitoring is enabled for your instances. To enable detailed monitoring, for **Monitoring**, select **Enable CloudWatch detailed monitoring**.
 - v. (Optional) To run a Dedicated Spot Instance, for **Tenancy**, choose **Dedicated - run a dedicated instance**.
 - vi. (Optional) For **Security groups**, choose one or more security groups or create a new one.

[Existing security group] Choose one or more security groups.

[New security group] Choose **Create new security group** to go the **Security Groups** page. When you are done, return to the **Spot Requests** and refresh the list.
 - vii. (Optional) To make your instances reachable from the internet, for **Auto-assign IPv4 Public IP**, choose **Enable**.
 - viii. (Optional) To launch your Spot Instances with an IAM role, for **IAM instance profile**, choose the role.
 - ix. (Optional) To run a start-up script, copy it to **User data**.
 - x. (Optional) To add a tag, choose **Create tag** and enter the key and value for the tag, and choose **Create**. Repeat for each tag.

For each tag, to tag the instances and the Spot Fleet request with the same tag, ensure that both **Instances** and **Fleet** are selected. To tag only the instances launched by the fleet, clear **Fleet**. To tag only the Spot Fleet request, clear **Instances**.

5. For **Additional request details**, do the following:
 - a. Review the additional request details. To make changes, clear **Apply defaults**.
 - b. (Optional) For **IAM fleet role**, you can use the default role or choose a different role. To use the default role after changing the role, choose **Use default role**.
 - c. (Optional) For **Maximum price**, you can use the default maximum price (the On-Demand price) or specify the maximum price you are willing to pay. If your maximum price is lower than the Spot price for the instance types that you selected, your Spot Instances are not launched.
 - d. (Optional) To create a request that is valid only during a specific time period, edit **Request valid from** and **Request valid until**.
 - e. (Optional) By default, we terminate your Spot Instances when the Spot Fleet request expires. To keep them running after your request expires, clear **Terminate the instances when the request expires**.
 - f. (Optional) To register your Spot Instances with a load balancer, choose **Receive traffic from one or more load balancers** and choose one or more Classic Load Balancers or target groups.
6. For **Minimum compute unit**, choose the minimum hardware specifications (vCPUs, memory, and storage) that you need for your application or task, either **as specs** or **as an instance type**.
 - For **as specs**, specify the required number of vCPUs and amount of memory.
 - For **as an instance type**, accept the default instance type, or choose **Change instance type** to choose a different instance type.
7. For **Target capacity**, do the following:
 - a. For **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**. To specify a target capacity of 0 so that you can add capacity later, choose **Maintain target capacity**.
 - b. (Optional) For **Include On-Demand base capacity**, specify the number of On-Demand units to request. The number must be less than the **Total target capacity**. Amazon EC2 calculates the difference, and allocates the difference to Spot units to request.
8. For **Network**, do the following:
 - a. For **Network**, choose an existing VPC or create a new one.

[Existing VPC] Choose the VPC.

- [New VPC] Choose **Create new VPC** to go to the Amazon VPC console. When you are done, return to the wizard and refresh the list.
- b. (Optional) For **Availability Zone**, let AWS choose the Availability Zones for your Spot Instances, or specify one or more Availability Zones.
- If you have more than one subnet in an Availability Zone, choose the appropriate subnet from **Subnet**. To add subnets, choose **Create new subnet** to go to the Amazon VPC console. When you are done, return to the wizard and refresh the list.
9. For **Instance type requirements**, you can either specify instance attributes and let Amazon EC2 identify the optimal instance types with these attributes, or you can specify a list of instances. For more information, see [Attribute-based instance type selection for Spot Fleet \(p. 1030\)](#).
- a. If you choose **Specify instance attributes that match your compute requirements**, specify your instance attributes as follows:
- i. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.
 - ii. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.
 - iii. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds a further constraint to your request. You can omit the additional attributes; when omitted, the default values are used. For a description of each attribute and their default values, see [get-spot-placement-scores](#) in the *Amazon EC2 Command Line Reference*.
 - iv. (Optional) To view the instance types with your specified attributes, expand **Preview matching instance types**. To exclude instance types from being used in your request, select the instances and then choose **Exclude selected instance types**.
- b. If you choose **Manually select instance types**, Spot Fleet provides a default list of instance types. To select more instance types, choose **Add instance types**, select the instance types to use in your request, and choose **Select**. To delete instance types, select the instance types and choose **Delete**.
10. For **Allocation strategy**, choose the strategy that meets your needs. For more information, see [Allocation strategies for Spot Instances \(p. 1027\)](#).
11. For **Your fleet request at a glance**, review your fleet configuration, and make any adjustments if necessary.
12. (Optional) To download a copy of the launch configuration for use with the AWS CLI, choose **JSON config**.
13. Choose **Launch**.

The Spot Fleet request type is `fleet`. When the request is fulfilled, requests of type `instance` are added, where the state is `active` and the status is `fulfilled`.

Create a Spot Fleet using the AWS CLI

To create a Spot Fleet request using the AWS CLI

- Use the [request-spot-fleet](#) command to create a Spot Fleet request.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For example configuration files, see [Spot Fleet example configurations \(p. 1121\)](#).

The following is example output:

```
{  
    "SpotFleetRequestId": "sfr-73fbdb2ce-aa30-494c-8788-1cee4EXAMPLE"  
}
```

Tag a Spot Fleet

To help categorize and manage your Spot Fleet requests, you can tag them with custom metadata. You can assign a tag to a Spot Fleet request when you create it, or afterward. You can assign tags using the Amazon EC2 console or a command line tool.

When you tag a Spot Fleet request, the instances and volumes that are launched by the Spot Fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the Spot Fleet. You can choose to assign tags to only the Spot Fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.

Note

Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.

For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

Contents

- [Prerequisite \(p. 1062\)](#)
- [Tag a new Spot Fleet \(p. 1063\)](#)
- [Tag a new Spot Fleet and the instances and volumes that it launches \(p. 1064\)](#)
- [Tag an existing Spot Fleet \(p. 1066\)](#)
- [View Spot Fleet request tags \(p. 1067\)](#)

Prerequisite

Grant the user the permission to tag resources. For more information, see [Example: Tag resources \(p. 1631\)](#).

To grant a user the permission to tag resources

Create an IAM policy that includes the following:

- The ec2:CreateTags action. This grants the user permission to create tags.
- The ec2:RequestSpotFleet action. This grants the user permission to create a Spot Fleet request.
- For Resource, you must specify "*". This allows users to tag all resource types.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "TagSpotFleetRequest",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags",  
                "ec2:RequestSpotFleet"  
            ],  
            "Resource": "*"  
        }  
    ]
```

}

Important

We currently do not support resource-level permissions for the `spot-fleet-request` resource. If you specify `spot-fleet-request` as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how *not* to set the policy.

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags",  
        "ec2:RequestSpotFleet"  
    ],  
    "Resource": "arn:aws:ec2:us-east-1:111122223333:spot-fleet-request/*"  
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center (successor to AWS Single Sign-On):

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide*.

- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.

- IAM users:

- Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Tag a new Spot Fleet

To tag a new Spot Fleet request using the console

1. Follow the [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#) procedure.
2. To add a tag, expand **Additional configurations**, choose **Add new tag**, and enter the key and value for the tag. Repeat for each tag.

For each tag, you can tag the Spot Fleet request and the instances with the same tag. To tag both, ensure that both **Instance tags** and **Fleet tags** are selected. To tag only the Spot Fleet request, clear **Instance tags**. To tag only the instances launched by the fleet, clear **Fleet tags**.

3. Complete the required fields to create a Spot Fleet request, and then choose **Launch**. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#).

To tag a new Spot Fleet request using the AWS CLI

To tag a Spot Fleet request when you create it, configure the Spot Fleet request configuration as follows:

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.

- For Tags, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the Spot Fleet request is tagged with two tags: Key=Environment and Value=Production, and Key=Cost-Center and Value=123.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IAMFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchSpecifications": [  
            {  
                "ImageId": "ami-0123456789EXAMPLE",  
                "InstanceType": "c4.large"  
            }  
        ],  
        "SpotPrice": "5",  
        "TargetCapacity": 2,  
        "TerminateInstancesWithExpiration": true,  
        "Type": "maintain",  
        "ReplaceUnhealthyInstances": true,  
        "InstanceInterruptionBehavior": "terminate",  
        "InstancePoolsToUseCount": 1,  
        "TagSpecifications": [  
            {  
                "ResourceType": "spot-fleet-request",  
                "Tags": [  
                    {  
                        "Key": "Environment",  
                        "Value": "Production"  
                    },  
                    {  
                        "Key": "Cost-Center",  
                        "Value": "123"  
                    }  
                ]  
            }  
        ]  
    }  
}
```

Tag a new Spot Fleet and the instances and volumes that it launches

To tag a new Spot Fleet request and the instances and volumes that it launches using the AWS CLI

To tag a Spot Fleet request when you create it, and to tag the instances and volumes when they are launched by the fleet, configure the Spot Fleet request configuration as follows:

Spot Fleet request tags:

- Specify the tags for the Spot Fleet request in SpotFleetRequestConfig.
- For ResourceType, specify spot-fleet-request. If you specify another value, the fleet request will fail.
- For Tags, specify the key-value pair. You can specify more than one key-value pair.

Instance tags:

- Specify the tags for the instances in LaunchSpecifications.
- For ResourceType, specify instance. If you specify another value, the fleet request will fail.

- For Tags, specify the key-value pair. You can specify more than one key-value pair.

Alternatively, you can specify the tags for the instance in the [launch template \(p. 570\)](#) that is referenced in the Spot Fleet request.

Volume tags:

- Specify the tags for the volumes in the [launch template \(p. 570\)](#) that is referenced in the Spot Fleet request. Volume tagging in LaunchSpecifications is not supported.

In the following example, the Spot Fleet request is tagged with two tags: Key=Environment and Value=Production, and Key=Cost-Center and Value=123. The instances that are launched by the fleet are tagged with one tag (which is the same as one of the tags for the Spot Fleet request): Key=Cost-Center and Value=123.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchSpecifications": [  
            {  
                "ImageId": "ami-0123456789EXAMPLE",  
                "InstanceType": "c4.large",  
                "TagSpecifications": [  
                    {  
                        "ResourceType": "instance",  
                        "Tags": [  
                            {  
                                "Key": "Cost-Center",  
                                "Value": "123"  
                            }  
                        ]  
                    }  
                ]  
            }  
        ],  
        "SpotPrice": "5",  
        "TargetCapacity": 2,  
        "TerminateInstancesWithExpiration": true,  
        "Type": "maintain",  
        "ReplaceUnhealthyInstances": true,  
        "InstanceInterruptionBehavior": "terminate",  
        "InstancePoolsToUseCount": 1,  
        "TagSpecifications": [  
            {  
                "ResourceType": "spot-fleet-request",  
                "Tags": [  
                    {  
                        "Key": "Environment",  
                        "Value": "Production"  
                    },  
                    {  
                        "Key": "Cost-Center",  
                        "Value": "123"  
                    }  
                ]  
            }  
        ]  
    }  
}
```

To tag instances launched by a Spot Fleet using the AWS CLI

To tag instances when they are launched by the fleet, you can either specify the tags in the [launch template \(p. 570\)](#) that is referenced in the Spot Fleet request, or you can specify the tags in the Spot Fleet request configuration as follows:

- Specify the tags for the instances in LaunchSpecifications.
- For ResourceType, specify instance. If you specify another value, the fleet request will fail.
- For Tags, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the instances that are launched by the fleet are tagged with one tag: Key=Cost-Center and Value=123.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IAMFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchSpecifications": [  
            {  
                "ImageId": "ami-0123456789EXAMPLE",  
                "InstanceType": "c4.large",  
                "TagSpecifications": [  
                    {  
                        "ResourceType": "instance",  
                        "Tags": [  
                            {  
                                "Key": "Cost-Center",  
                                "Value": "123"  
                            }  
                        ]  
                    }  
                ]  
            }  
        ],  
        "SpotPrice": "5",  
        "TargetCapacity": 2,  
        "TerminateInstancesWithExpiration": true,  
        "Type": "maintain",  
        "ReplaceUnhealthyInstances": true,  
        "InstanceInterruptionBehavior": "terminate",  
        "InstancePoolsToUseCount": 1  
    }  
}
```

To tag volumes attached to On-Demand Instances launched by a Spot Fleet using the AWS CLI

To tag volumes when they are created by the fleet, you must specify the tags in the [launch template \(p. 570\)](#) that is referenced in the Spot Fleet request.

Note

Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.
Volume tagging in LaunchSpecifications is not supported.

Tag an existing Spot Fleet

To tag an existing Spot Fleet request using the console

After you have created a Spot Fleet request, you can add tags to the fleet request using the console.

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Tags** tab and choose **Create Tag**.

To tag an existing Spot Fleet request using the AWS CLI

You can use the [create-tags](#) command to tag existing resources. In the following example, the existing Spot Fleet request is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
--resources sfr-11112222-3333-4444-5555-66666EXAMPLE \
--tags Key=purpose,Value=test
```

View Spot Fleet request tags

To view Spot Fleet request tags using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Tags** tab.

To describe Spot Fleet request tags

Use the [describe-tags](#) command to view the tags for the specified resource. In the following example, you describe the tags for the specified Spot Fleet request.

```
aws ec2 describe-tags \
--filters "Name=resource-id,Values=sfr-11112222-3333-4444-5555-66666EXAMPLE"
```

```
{
  "Tags": [
    {
      "Key": "Environment",
      "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
      "ResourceType": "spot-fleet-request",
      "Value": "Production"
    },
    {
      "Key": "Another key",
      "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
      "ResourceType": "spot-fleet-request",
      "Value": "Another value"
    }
  ]
}
```

You can also view the tags of a Spot Fleet request by describing the Spot Fleet request.

Use the [describe-spot-fleet-requests](#) command to view the configuration of the specified Spot Fleet request, which includes any tags that were specified for the fleet request.

```
aws ec2 describe-spot-fleet-requests \
--spot-fleet-request-ids sfr-11112222-3333-4444-5555-66666EXAMPLE
```

```
{  
    "SpotFleetRequestConfigs": [  
        {  
            "ActivityStatus": "fulfilled",  
            "CreateTime": "2020-02-13T02:49:19.709Z",  
            "SpotFleetRequestConfig": {  
                "AllocationStrategy": "capacityOptimized",  
                "OnDemandAllocationStrategy": "lowestPrice",  
                "ExcessCapacityTerminationPolicy": "Default",  
                "FulfilledCapacity": 2.0,  
                "OnDemandFulfilledCapacity": 0.0,  
                "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
                "LaunchSpecifications": [  
                    {  
                        "ImageId": "ami-0123456789EXAMPLE",  
                        "InstanceType": "c4.large"  
                    }  
                ],  
                "TargetCapacity": 2,  
                "OnDemandTargetCapacity": 0,  
                "Type": "maintain",  
                "ReplaceUnhealthyInstances": false,  
                "InstanceInterruptionBehavior": "terminate"  
            },  
            "SpotFleetRequestId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",  
            "SpotFleetRequestState": "active",  
            "Tags": [  
                {  
                    "Key": "Environment",  
                    "Value": "Production"  
                },  
                {  
                    "Key": "Another key",  
                    "Value": "Another value"  
                }  
            ]  
        }  
    ]  
}
```

Describe your Spot Fleet

The Spot Fleet launches Spot Instances when your maximum price exceeds the Spot price and capacity is available. The Spot Instances run until they are interrupted or you terminate them.

To describe your Spot Fleet (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request. To see the configuration details, choose **Description**.
4. To list the Spot Instances for the Spot Fleet, choose **Instances**.
5. To view the history for the Spot Fleet, choose **History**.

To describe your Spot Fleet (AWS CLI)

Use the [describe-spot-fleet-requests](#) command to describe your Spot Fleet requests.

```
aws ec2 describe-spot-fleet-requests
```

Use the [describe-spot-fleet-instances](#) command to describe the Spot Instances for the specified Spot Fleet.

```
aws ec2 describe-spot-fleet-instances \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE
```

Use the [describe-spot-fleet-request-history](#) command to describe the history for the specified Spot Fleet request.

```
aws ec2 describe-spot-fleet-request-history \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--start-time 2015-05-18T00:00:00Z
```

Modify a Spot Fleet request

You can modify an active Spot Fleet request to complete the following tasks:

- Increase the target capacity and On-Demand portion
- Decrease the target capacity and On-Demand portion

Note

You can't modify a one-time Spot Fleet request. You can only modify a Spot Fleet request if you selected **Maintain target capacity** when you created the Spot Fleet request.

When you increase the target capacity, the Spot Fleet launches additional Spot Instances. When you increase the On-Demand portion, the Spot Fleet launches additional On-Demand Instances.

When you increase the target capacity, the Spot Fleet launches the additional Spot Instances according to the allocation strategy for its Spot Fleet request. If the allocation strategy is `lowestPrice`, the Spot Fleet launches the instances from the lowest priced Spot capacity pool in the Spot Fleet request. If the allocation strategy is `diversified`, the Spot Fleet distributes the instances across the pools in the Spot Fleet request.

When you decrease the target capacity, the Spot Fleet cancels any open requests that exceed the new target capacity. You can request that the Spot Fleet terminate Spot Instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `lowestPrice`, the Spot Fleet terminates the instances with the highest price per unit. If the allocation strategy is `diversified`, the Spot Fleet terminates instances across the pools. Alternatively, you can request that the Spot Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

To modify a Spot Fleet request (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions, Modify target capacity**.
5. In **Modify target capacity**, do the following:
 - a. Enter the new target capacity and On-Demand portion.
 - b. (Optional) If you are decreasing the target capacity but want to keep the fleet at its current size, clear **Terminate instances**.

- c. Choose **Submit**.

To modify a Spot Fleet request using the AWS CLI

Use the [modify-spot-fleet-request](#) command to update the target capacity of the specified Spot Fleet request.

```
aws ec2 modify-spot-fleet-request \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity 20
```

You can modify the previous command as follows to decrease the target capacity of the specified Spot Fleet without terminating any Spot Instances as a result.

```
aws ec2 modify-spot-fleet-request \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity 10 \
--excess-capacity-termination-policy NoTermination
```

Cancel a Spot Fleet request

If you no longer require a Spot Fleet, you can cancel the Spot Fleet request. After you cancel a fleet request, all Spot requests associated with the fleet are also canceled, so that no new Spot Instances are launched.

When you cancel a Spot Fleet request, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances.

If you specify that the instances must be terminated when the fleet request is canceled, the fleet request enters the `cancelled_terminating` state. Otherwise, the fleet request enters the `cancelled_running` state and the instances continue to run until they are interrupted or you terminate them manually.

To cancel a Spot Fleet request (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions, Cancel request**.
5. In the **Cancel Spot request** dialog box, do the following:
 - a. To terminate the associated instances at the same time as canceling the Spot Fleet request, leave the **Terminate instances** check box selected. To cancel the Spot Fleet request without terminating the associated instances, clear the **Terminate instances** check box.
 - b. Choose **Confirm**.

To cancel a Spot Fleet request and terminate its instances using the AWS CLI

Use the [cancel-spot-fleet-requests](#) command to cancel the specified Spot Fleet request and terminate its On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
--spot-fleet-request-ids sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--terminate-instances
```

Example output

```
{  
    "SuccessfulFleetRequests": [  
        {  
            "SpotFleetRequestId": "sfr-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE",  
            "CurrentSpotFleetRequestState": "cancelled_terminating",  
            "PreviousSpotFleetRequestState": "active"  
        }  
    ],  
    "UnsuccessfulFleetRequests": []  
}
```

To cancel a Spot Fleet request without terminating its instances using the AWS CLI

You can modify the previous command using the `--no-terminate-instances` parameter to cancel the specified Spot Fleet request without terminating its On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \  
  --spot-fleet-request-ids sfr-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE \  
  --no-terminate-instances
```

Example output

```
{  
    "SuccessfulFleetRequests": [  
        {  
            "SpotFleetRequestId": "sfr-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE",  
            "CurrentSpotFleetRequestState": "cancelled_running",  
            "PreviousSpotFleetRequestState": "active"  
        }  
    ],  
    "UnsuccessfulFleetRequests": []  
}
```

CloudWatch metrics for Spot Fleet

Amazon EC2 provides Amazon CloudWatch metrics that you can use to monitor your Spot Fleet.

Important

To ensure accuracy, we recommend that you enable detailed monitoring when using these metrics. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 1183\)](#).

For more information about CloudWatch metrics provided by Amazon EC2, see [Monitor your instances using CloudWatch \(p. 1183\)](#).

Spot Fleet metrics

The AWS/EC2Spot namespace includes the following metrics, plus the CloudWatch metrics for the Spot Instances in your fleet. For more information, see [Instance metrics \(p. 1185\)](#).

Metric	Description
AvailableInstancePoolsCount	The Spot capacity pools specified in the Spot Fleet request. Units: Count

Metric	Description
BidsSubmittedForCapacity	The capacity for which Amazon EC2 has submitted Spot Fleet requests. Units: Count
EligibleInstancePoolCount	The Spot capacity pools specified in the Spot Fleet request where Amazon EC2 can fulfill requests. Amazon EC2 does not fulfill requests in pools where the maximum price you're willing to pay for Spot Instances is less than the Spot price or the Spot price is greater than the price for On-Demand Instances. Units: Count
FulfilledCapacity	The capacity that Amazon EC2 has fulfilled. Units: Count
MaxPercentCapacityAllocation	The maximum value of PercentCapacityAllocation across all Spot Fleet pools specified in the Spot Fleet request. Units: Percent
PendingCapacity	The difference between TargetCapacity and FulfilledCapacity. Units: Count
PercentCapacityAllocation	The capacity allocated for the Spot capacity pool for the specified dimensions. To get the maximum value recorded across all Spot capacity pools, use MaxPercentCapacityAllocation. Units: Percent
TargetCapacity	The target capacity of the Spot Fleet request. Units: Count
TerminatingCapacity	The capacity that is being terminated because the provisioned capacity is greater than the target capacity. Units: Count

If the unit of measure for a metric is Count, the most useful statistic is Average.

Spot Fleet dimensions

To filter the data for your Spot Fleet, use the following dimensions.

Dimensions	Description
AvailabilityZone	Filter the data by Availability Zone.
FleetRequestId	Filter the data by Spot Fleet request.
InstanceType	Filter the data by instance type.

View the CloudWatch metrics for your Spot Fleet

You can view the CloudWatch metrics for your Spot Fleet using the Amazon CloudWatch console. These metrics are displayed as monitoring graphs. These graphs show data points if the Spot Fleet is active.

Metrics are grouped first by namespace, and then by the various combinations of dimensions within each namespace. For example, you can view all Spot Fleet metrics or Spot Fleet metrics groups by Spot Fleet request ID, instance type, or Availability Zone.

To view Spot Fleet metrics

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2 Spot** namespace.

Note

If the **EC2 Spot** namespace is not displayed, there are two reasons for this. Either you've not yet used Spot Fleet—only the AWS services that you're using send metrics to Amazon CloudWatch. Or, if you've not used Spot Fleet for the past two weeks, the namespace does not appear.

4. (Optional) To filter the metrics by dimension, select one of the following:
 - **Fleet Request Metrics** – Group by Spot Fleet request
 - **By Availability Zone** – Group by Spot Fleet request and Availability Zone
 - **By Instance Type** – Group by Spot Fleet request and instance type
 - **By Availability Zone/Instance Type** – Group by Spot Fleet request, Availability Zone, and instance type
5. To view the data for a metric, select the check box next to the metric.

FleetRequestId	Metric Name
sfr-4a707781-8fac-459b-a5ae-4701fce47d7	AvailableInstancePoolsCount
sfr-4a707781-8fac-459b-a5ae-4701fce47d7	BidsSubmittedForCapacity
<input checked="" type="checkbox"/> sfr-4a707781-8fac-459b-a5ae-4701fce47d7	CPUUtilization
sfr-4a707781-8fac-459b-a5ae-4701fce47d7	DiskReadBytes

Automatic scaling for Spot Fleet

Automatic scaling is the ability to increase or decrease the target capacity of your Spot Fleet automatically based on demand. A Spot Fleet can either launch instances (scale out) or terminate instances (scale in), within the range that you choose, in response to one or more scaling policies.

Spot Fleet supports the following types of automatic scaling:

- [Target tracking scaling \(p. 1075\)](#) – Increase or decrease the current capacity of the fleet based on a target value for a specific metric. This is similar to the way that your thermostat maintains the temperature of your home—you select temperature and the thermostat does the rest.

- [Step scaling \(p. 1076\)](#) – Increase or decrease the current capacity of the fleet based on a set of scaling adjustments, known as step adjustments, that vary based on the size of the alarm breach.
 - [Scheduled scaling \(p. 1078\)](#) – Increase or decrease the current capacity of the fleet based on the date and time.

If you are using [instance weighting \(p. 1048\)](#), keep in mind that Spot Fleet can exceed the target capacity as needed. Fulfilled capacity can be a floating-point number but target capacity must be an integer, so Spot Fleet rounds up to the next integer. You must take these behaviors into account when you look at the outcome of a scaling policy when an alarm is triggered. For example, suppose that the target capacity is 30, the fulfilled capacity is 30.1, and the scaling policy subtracts 1. When the alarm is triggered, the automatic scaling process subtracts 1 from 30.1 to get 29.1 and then rounds it up to 30, so no scaling action is taken. As another example, suppose that you selected instance weights of 2, 4, and 8, and a target capacity of 10, but no weight 2 instances were available so Spot Fleet provisioned instances of weights 4 and 8 for a fulfilled capacity of 12. If the scaling policy decreases target capacity by 20% and an alarm is triggered, the automatic scaling process subtracts 12×0.2 from 12 to get 9.6 and then rounds it up to 10, so no scaling action is taken.

The scaling policies that you create for Spot Fleet support a cooldown period. This is the number of seconds after a scaling activity completes where previous trigger-related scaling activities can influence future scaling events. For scale-out policies, while the cooldown period is in effect, the capacity that has been added by the previous scale-out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. The intention is to continuously (but not excessively) scale out. For scale in policies, the cooldown period is used to block subsequent scale in requests until it has expired. The intention is to scale in conservatively to protect your application's availability. However, if another alarm triggers a scale-out policy during the cooldown period after a scale-in, automatic scaling scales out your scalable target immediately.

We recommend that you scale based on instance metrics with a 1-minute frequency because that ensures a faster response to utilization changes. Scaling on metrics with a 5-minute frequency can result in slower response time and scaling on stale metric data. To send metric data for your instances to CloudWatch in 1-minute periods, you must specifically enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 1183\)](#) and [Create a Spot Fleet request using defined parameters \(console\) \(p. 1059\)](#).

For more information about configuring scaling for Spot Fleet, see the following resources:

- [application-autoscaling](#) section of the *AWS CLI Command Reference*
 - [Application Auto Scaling API Reference](#)
 - [Application Auto Scaling User Guide](#)

IAM permissions required for Spot Fleet automatic scaling

Automatic scaling for Spot Fleet is made possible by a combination of the Amazon EC2, Amazon CloudWatch, and Application Auto Scaling APIs. Spot Fleet requests are created with Amazon EC2, alarms are created with CloudWatch, and scaling policies are created with Application Auto Scaling.

In addition to the [IAM permissions for Spot Fleet \(p. 1052\)](#) and Amazon EC2, the user that accesses fleet scaling settings must have the appropriate permissions for the services that support dynamic scaling. Users must have permissions to use the actions shown in the following example policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [
```

```
"application-autoscaling:*",
"ec2:DescribeSpotFleetRequests",
"ec2:ModifySpotFleetRequest",
"cloudwatch:DeleteAlarms",
"cloudwatch:DescribeAlarmHistory",
"cloudwatch:DescribeAlarms",
"cloudwatch:DescribeAlarmsForMetric",
"cloudwatch:GetMetricStatistics",
"cloudwatch>ListMetrics",
"cloudwatch:PutMetricAlarm",
"cloudwatch:DisableAlarmActions",
"cloudwatch:EnableAlarmActions",
"iam>CreateServiceLinkedRole",
"sns>CreateTopic",
"sns:Subscribe",
"sns:Get*",
"sns>List*"
],
"Resource": "*"
}
]
```

You can also create your own IAM policies that allow more fine-grained permissions for calls to the Application Auto Scaling API. For more information, see [Authentication and Access Control](#) in the *Application Auto Scaling User Guide*.

The Application Auto Scaling service also needs permission to describe your Spot Fleet and CloudWatch alarms, and permissions to modify your Spot Fleet target capacity on your behalf. If you enable automatic scaling for your Spot Fleet, it creates a service-linked role named AWSServiceRoleForApplicationAutoScaling_EC2SpotFleetRequest. This service-linked role grants Application Auto Scaling permission to describe the alarms for your policies, to monitor the current capacity of the fleet, and to modify the capacity of the fleet. The original managed Spot Fleet role for Application Auto Scaling was aws-ec2-spot-fleet-autoscale-role, but it is no longer required. The service-linked role is the default role for Application Auto Scaling. For more information, see [Service-Linked Roles](#) in the *Application Auto Scaling User Guide*.

Scale Spot Fleet using a target tracking policy

With target tracking scaling policies, you select a metric and set a target value. Spot Fleet creates and manages the CloudWatch alarms that trigger the scaling policy and calculates the scaling adjustment based on the metric and the target value. The scaling policy adds or removes capacity as required to keep the metric at, or close to, the specified target value. In addition to keeping the metric close to the target value, a target tracking scaling policy also adjusts to the fluctuations in the metric due to a fluctuating load pattern and minimizes rapid fluctuations in the capacity of the fleet.

You can create multiple target tracking scaling policies for a Spot Fleet, provided that each of them uses a different metric. The fleet scales based on the policy that provides the largest fleet capacity. This enables you to cover multiple scenarios and ensure that there is always enough capacity to process your application workloads.

To ensure application availability, the fleet scales out proportionally to the metric as fast as it can, but scales in more gradually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Do not edit or delete the CloudWatch alarms that Spot Fleet manages for a target tracking scaling policy. Spot Fleet deletes the alarms automatically when you delete the target tracking scaling policy.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or `Spot blocks`.

To configure a target tracking policy (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose **Auto Scaling**.
4. If automatic scaling is not configured, choose **Configure**.
5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.
6. For **Policy name**, enter a name for the policy.
7. Choose a **Target metric**.
8. Enter a **Target value** for the metric.
9. (Optional) Set **Cooldown period** to modify the default cooldown period.
10. (Optional) Select **Disable scale-in** to omit creating a scale-in policy based on the current configuration. You can create a scale-in policy using a different configuration.
11. Choose **Save**.

To configure a target tracking policy using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the [register-scalable-target](#) command.
2. Create a scaling policy using the [put-scaling-policy](#) command.

Scale Spot Fleet using step scaling policies

With step scaling policies, you specify CloudWatch alarms to trigger the scaling process. For example, if you want to scale out when CPU utilization reaches a certain level, create an alarm using the `CPUUtilization` metric provided by Amazon EC2.

When you create a step scaling policy, you must specify one of the following scaling adjustment types:

- **Add** – Increase the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Remove** – Decrease the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Set to** – Set the target capacity of the fleet to the specified number of capacity units.

When an alarm is triggered, the automatic scaling process calculates the new target capacity using the fulfilled capacity and the scaling policy, and then updates the target capacity accordingly. For example, suppose that the target capacity and fulfilled capacity are 10 and the scaling policy adds 1. When the alarm is triggered, the automatic scaling process adds 1 to 10 to get 11, so Spot Fleet launches 1 instance.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or `Spot blocks`.

Prerequisites

- Consider which CloudWatch metrics are important to your application. You can create CloudWatch alarms based on metrics provided by AWS or your own custom metrics.
- For the AWS metrics that you will use in your scaling policies, enable CloudWatch metrics collection if the service that provides the metrics does not enable it by default.

To create a CloudWatch alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
 2. In the navigation pane, choose **Alarms**.
 3. Choose **Create alarm**.
 4. On the **Specify metric and conditions** page, choose **Select metric**.
 5. Choose **EC2 Spot, Fleet Request Metrics**, select a metric (for example, TargetCapacity), and then choose **Select metric**.
- The **Specify metric and conditions** page appears, showing a graph and other information about the metric you selected.
6. For **Period**, choose the evaluation period for the alarm, for example, 1 minute. When evaluating the alarm, each period is aggregated into one data point.

Note

A shorter period creates a more sensitive alarm.

7. For **Conditions**, define the alarm by defining the threshold condition. For example, you can define a threshold to trigger the alarm whenever the value of the metric is greater than or equal to 80 percent.
8. Under **Additional configuration**, for **Datapoints to alarm**, specify how many datapoints (evaluation periods) must be in the ALARM state to trigger the alarm, for example, 1 evaluation period or 2 out of 3 evaluation periods. This creates an alarm that goes to ALARM state if that many consecutive periods are breaching. For more information, see [Evaluating an Alarm](#) in the *Amazon CloudWatch User Guide*.
9. For **Missing data treatment**, choose one of the options (or leave the default of **Treat missing data as missing**). For more information, see [Configuring How CloudWatch Alarms Treat Missing Data](#) in the *Amazon CloudWatch User Guide*.
10. Choose **Next**.
11. (Optional) To receive notification of a scaling event, for **Notification**, you can choose or create the Amazon SNS topic you want to use to receive notifications. Otherwise, you can delete the notification now and add one later as needed.
12. Choose **Next**.
13. Under **Add a description**, enter a name and description for the alarm and choose **Next**.
14. Choose **Create alarm**.

To configure a step scaling policy for your Spot Fleet (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose **Auto Scaling**.
4. If automatic scaling is not configured, choose **Configure**.
5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.
6. Initially, **Scaling policies** contains policies named ScaleUp and ScaleDown. You can complete these policies, or choose **Remove policy** to delete them. You can also choose **Add policy**.

7. To define a policy, do the following:
 - a. For **Policy name**, enter a name for the policy.
 - b. For **Policy trigger**, select an existing alarm or choose **Create new alarm** to open the Amazon CloudWatch console and create an alarm.
 - c. For **Modify capacity**, select a scaling adjustment type, select a number, and select a unit.
 - d. (Optional) To perform step scaling, choose **Define steps**. By default, an add policy has a lower bound of -infinity and an upper bound of the alarm threshold. By default, a remove policy has a lower bound of the alarm threshold and an upper bound of +infinity. To add another step, choose **Add step**.
 - e. (Optional) To modify the default value for the cooldown period, select a number from **Cooldown period**.
8. Choose **Save**.

To configure step scaling policies for your Spot Fleet using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the [register-scalable-target](#) command.
2. Create a scaling policy using the [put-scaling-policy](#) command.
3. Create an alarm that triggers the scaling policy using the [put-metric-alarm](#) command.

Scale Spot Fleet using scheduled scaling

Scaling based on a schedule enables you to scale your application in response to predictable changes in demand. To use scheduled scaling, you create *scheduled actions*, which tell Spot Fleet to perform scaling activities at specific times. When you create a scheduled action, you specify an existing Spot Fleet, when the scaling activity should occur, minimum capacity, and maximum capacity. You can create scheduled actions that scale one time only or that scale on a recurring schedule.

You can only create a scheduled action for Spot Fleets that already exist. You can't create a scheduled action at the same time that you create a Spot Fleet.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or `Spot blocks`.

To create a one-time scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Choose **Create Scheduled Action**.
5. For **Name**, specify a name for the scheduled action.
6. Enter a value for **Minimum capacity**, **Maximum capacity**, or both.
7. For **Recurrence**, choose **Once**.
8. (Optional) Choose a date and time for **Start time**, **End time**, or both.
9. Choose **Submit**.

To scale on a recurring schedule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. For **Recurrence**, choose one of the predefined schedules (for example, **Every day**), or choose **Custom** and enter a cron expression. For more information about the cron expressions supported by scheduled scaling, see [Cron Expressions](#) in the *Amazon CloudWatch Events User Guide*.
5. (Optional) Choose a date and time for **Start time**, **End time**, or both.
6. Choose **Submit**.

To edit a scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Select the scheduled action and choose **Actions**, **Edit**.
5. Make the needed changes and choose **Submit**.

To delete a scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Select the scheduled action and choose **Actions**, **Delete**.
5. When prompted for confirmation, choose **Delete**.

To manage scheduled scaling using the AWS CLI

Use the following commands:

- [put-scheduled-action](#)
- [describe-scheduled-actions](#)
- [delete-scheduled-action](#)

Monitor fleet events using Amazon EventBridge

When the state of an EC2 Fleet or Spot Fleet changes, the fleet emits a notification. The notification is made available as an event that is sent to Amazon EventBridge (formerly known as Amazon CloudWatch Events). Events are emitted on a best effort basis.

With Amazon EventBridge, you can create rules that trigger programmatic actions in response to an event. For example, you can create two EventBridge rules, one that's triggered when a fleet state changes, and one that's triggered when an instance in the fleet is terminated. You can configure the first rule so that, if the fleet state changes, the rule invokes an SNS topic to send an email notification to you. You can configure the second rule so that, if an instance is terminated, the rule invokes a Lambda function to launch a new instance.

Topics

- [EC2 Fleet event types \(p. 1080\)](#)
- [Spot Fleet event types \(p. 1084\)](#)

- [Create Amazon EventBridge rules \(p. 1089\)](#)

EC2 Fleet event types

Note

Only fleets of type `maintain` and `request` emit events. Fleets of type `instant` do not emit events because they submit synchronous one-time requests, and the state of the fleet is known immediately in the response.

There are five EC2 Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

```
"source": "aws.ec2fleet"  
  
        Identifies that the event is from EC2 Fleet.  
"detail-type": "EC2 Fleet State Change"  
  
        Identifies the event type.  
"detail": { "sub-type": "submitted" }  
  
        Identifies the event sub-type.
```

Event types

- [EC2 Fleet State Change \(p. 1080\)](#)
- [EC2 Fleet Spot Instance Request Change \(p. 1081\)](#)
- [EC2 Fleet Instance Change \(p. 1082\)](#)
- [EC2 Fleet Information \(p. 1083\)](#)
- [EC2 Fleet Error \(p. 1083\)](#)

EC2 Fleet State Change

EC2 Fleet sends an `EC2 Fleet State Change` event to Amazon EventBridge when an EC2 Fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "715ed6b3-b8fc-27fe-fad6-528c7b8bf8a2",  
    "detail-type": "EC2 Fleet State Change",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T09:00:20Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-  
        be4d-6b0809bfff0a"  
    ],  
    "detail": {  
        "sub-type": "active"  
    }  
}
```

The possible values for sub-type are:

`active`

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

`deleted`

The EC2 Fleet request is deleted and has no running instances. The EC2 Fleet will be deleted two days after its instances are terminated.

`deleted_running`

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

`deleted_terminating`

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

`expired`

The EC2 Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent terminated event indicates that the instances are terminated.

`modify_in_progress`

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed.

`modify_succeeded`

The EC2 Fleet request was modified.

`submitted`

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

`progress`

The EC2 Fleet request is in the process of being fulfilled.

EC2 Fleet Spot Instance Request Change

EC2 Fleet sends an EC2 Fleet Spot Instance Request Change event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "19331f74-bf4b-a3dd-0f1b-ddb1422032b9",  
    "detail-type": "EC2 Fleet Spot Instance Request Change",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T09:00:05Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/  
        fleet-83fd4e48-552a-40ef-9532-82a3acca5f10"]  
}
```

```
],
  "detail": {
    "spot-instance-request-id": "sir-rmqsk6h",
    "description": "SpotInstanceRequestId sir-rmqsk6h, PreviousState:
cancelled_running",
    "sub-type": "cancelled"
  }
}
```

The possible values for sub-type are:

active

The Spot Instance request is fulfilled and has an associated Spot Instance.

cancelled

You cancelled the Spot Instance request, or the Spot Instance request expired.

disabled

You stopped the Spot Instance.

submitted

The Spot Instance request is submitted.

EC2 Fleet Instance Change

EC2 Fleet sends an EC2 Fleet Instance Change event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
  "version": "0",
  "id": "542ce428-c8f1-0608-c015-e8ed6522c5bc",
  "detail-type": "EC2 Fleet Instance Change",
  "source": "aws.ec2fleet",
  "account": "123456789012",
  "time": "2020-11-09T09:00:23Z",
  "region": "us-east-1",
  "resources": [
    "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-
be4d-6b0809bfff0a"
  ],
  "detail": {
    "instance-id": "i-0c594155dd5ff1829",
    "description": "{\"instanceType\":\"c5.large\",\"image\":\"ami-6057e21a\",
\"productDescription\":\"Linux/UNIX\",\"availabilityZone\":\"us-east-1d\"}",
    "sub-type": "launched"
  }
}
```

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.

termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Fleet Information

EC2 Fleet sends an EC2 Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "76529817-d605-4571-7224-d36cc1b2c0c4",  
    "detail-type": "EC2 Fleet Information",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:17:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-8becf5fe-  
        bb9e-415d-8f54-3fa5a8628b91"  
    ],  
    "detail": {  
        "description": "c4.xlarge, ami-0947d2ba12ee1ff75, Linux/UNIX, us-east-1a,  
        Spot price in either SpotFleetRequestConfigData or SpotFleetLaunchSpecification or  
        LaunchTemplate or LaunchTemplateOverrides is less than Spot market price $0.0619",  
        "sub-type": "launchSpecUnusable"  
    }  
}
```

The possible values for sub-type are:

fleetProgressHalted

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced launchSpecUnusable events). A launch specification might become valid if the Spot price changes.

launchSpecTemporarilyBlacklisted

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

launchSpecUnusable

The price in a launch specification is not valid because it is below the Spot price.

registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Fleet Error

EC2 Fleet sends an EC2 Fleet Error event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "69849a22-6d0f-d4ce-602b-b47c1c98240e",  
    "detail-type": "EC2 Fleet Error",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-10-07T01:44:24Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-9bb19bc6-60d3-4fd2-ae47-  
        d33e68eafa08"  
    ],  
    "detail": {  
        "description": "m3.large, ami-00068cd7555f543d5, Linux/UNIX: IPv6 is not supported  
        for the instance type 'm3.large'. ",  
        "sub-type": "spotFleetRequestConfigurationInvalid"  
    }  
}
```

The possible values for sub-type are:

iamFleetRoleInvalid

The EC2 Fleet does not have the required permissions to either launch or terminate an instance.

allLaunchSpecsTemporarilyBlacklisted

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

spotInstanceCountLimitExceeded

You've reached the limit on the number of Spot Instances that you can launch.

spotFleetRequestConfigurationInvalid

The configuration is not valid. For more information, see the description of the event.

Spot Fleet event types

There are five Spot Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

"source": "aws.ec2spotfleet"

Identifies that the event is from Spot Fleet.

"detail-type": "*EC2 Spot Fleet State Change*"

Identifies the event type.

"detail": { "sub-type": "*submitted*" }

Identifies the event sub-type.

Event types

- [EC2 Spot Fleet State Change \(p. 1085\)](#)
- [EC2 Spot Fleet Spot Instance Request Change \(p. 1086\)](#)
- [EC2 Spot Fleet Instance Change \(p. 1086\)](#)

- [EC2 Spot Fleet Information \(p. 1087\)](#)
- [EC2 Spot Fleet Error \(p. 1088\)](#)

EC2 Spot Fleet State Change

Spot Fleet sends an EC2 Spot Fleet State Change event to Amazon EventBridge when a Spot Fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "d1af1091-6cc3-2e24-203a-3b870e455d5b",  
    "detail-type": "EC2 Spot Fleet State Change",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:57:06Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-4b6d274d-0cea-4b2c-  
        b3be-9dc627ad1f55"  
    ],  
    "detail": {  
        "sub-type": "submitted"  
    }  
}
```

The possible values for sub-type are:

active

The Spot Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

cancelled

The Spot Fleet request is canceled and has no running instances. The Spot Fleet will be deleted two days after its instances are terminated.

cancelled_running

The Spot Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

cancelled_terminating

The Spot Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.

expired

The Spot Fleet request has expired. If the request was created with TerminateInstancesWithExpiration set, a subsequent terminated event indicates that the instances are terminated.

modify_in_progress

The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed.

modify_succeeded

The Spot Fleet request was modified.

submitted

The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

progress

The Spot Fleet request is in the process of being fulfilled.

EC2 Spot Fleet Spot Instance Request Change

Spot Fleet sends an EC2 Spot Fleet Spot Instance Request Change event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "cd141ef0-14af-d670-a71d-fe46e9971bd2",  
    "detail-type": "EC2 Spot Fleet Spot Instance Request Change",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:53:21Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-  
a98d2133-941a-47dc-8b03-0f94c6852ad1"  
    ],  
    "detail": {  
        "spot-instance-request-id": "sir-a2w9gc5h",  
        "description": "SpotInstanceRequestId sir-a2w9gc5h, PreviousState:  
cancelled_running",  
        "sub-type": "cancelled"  
    }  
}
```

The possible values for sub-type are:

active

The Spot Instance request is fulfilled and has an associated Spot Instance.

cancelled

You cancelled the Spot Instance request, or the Spot Instance request expired.

disabled

You stopped the Spot Instance.

submitted

The Spot Instance request is submitted.

EC2 Spot Fleet Instance Change

Spot Fleet sends an EC2 Spot Fleet Instance Change event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
```

```
"version": "0",
"id": "11591686-5bd7-bbaa-eb40-d46529c2710f",
"detail-type": "EC2 Spot Fleet Instance Change",
"source": "aws.ec2spotfleet",
"account": "123456789012",
"time": "2020-11-09T07:25:02Z",
"region": "us-east-1",
"resources": [
    "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-c8a764a4-bedc-4b62-
af9c-0095e6e3ba61"
],
"detail": {
    "instance-id": "i-08b90df1e09c30c9b",
    "description": "{\"instanceType\":\"r4.2xlarge\", \"image\":\"ami-032930428bf1abbff\",
\", \"productDescription\":\"Linux/UNIX\", \"availabilityZone\":\"us-east-1a\"}",
    "sub-type": "launched"
}
}
```

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.

termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Spot Fleet Information

Spot Fleet sends an EC2 Spot Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
    "version": "0",
    "id": "73a60f70-3409-a66c-635c-7f66c5f5b669",
    "detail-type": "EC2 Spot Fleet Information",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-08T20:56:12Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-2531ea06-
af18-4647-8757-7d69c94971b1"
    ],
    "detail": {
        "description": "r3.8xlarge, ami-032930428bf1abbff, Linux/UNIX, us-east-1a, Spot bid
price is less than Spot market price $0.5291",
        "sub-type": "launchSpecUnusable"
    }
}
```

The possible values for sub-type are:

`fleetProgressHalted`

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced `launchSpecUnusable` events). A launch specification might become valid if the Spot price changes.

`launchSpecTemporarilyBlacklisted`

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

`launchSpecUnusable`

The price in a launch specification is not valid because it is below the Spot price.

`registerWithLoadBalancersFailed`

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Spot Fleet Error

Spot Fleet sends an `EC2 Spot Fleet Error` event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "10adc4e7-675c-643e-125c-5bfa1b1ba5d2",  
    "detail-type": "EC2 Spot Fleet Error",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T06:56:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/  
sfr-38725d30-25f1-4f30-83ce-2907c56dba17"  
    ],  
    "detail": {  
        "description": "r4.2xlarge, ami-032930428bf1abbff, Linux/UNIX: The  
associatePublicIPAddress parameter can only be specified for the network interface with  
DeviceIndex 0.",  
        "sub-type": "spotFleetRequestConfigurationInvalid"  
    }  
}
```

The possible values for sub-type are:

`iamFleetRoleInvalid`

The Spot Fleet does not have the required permissions to either launch or terminate an instance.

`allLaunchSpecsTemporarilyBlacklisted`

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

`spotInstanceCountLimitExceeded`

You've reached the limit on the number of Spot Instances that you can launch.

`spotFleetRequestConfigurationInvalid`

The configuration is not valid. For more information, see the description of the event.

Create Amazon EventBridge rules

When a notification of a state change is emitted for an EC2 Fleet or Spot Fleet, the event for the notification is sent to Amazon EventBridge. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes a target (or targets) specified in the rule.

You can write an EventBridge rule and automate what actions to take when the event pattern matches the rule.

Topics

- [Create Amazon EventBridge rules to monitor EC2 Fleet events \(p. 1089\)](#)
- [Create Amazon EventBridge rules to monitor Spot Fleet events \(p. 1092\)](#)

Create Amazon EventBridge rules to monitor EC2 Fleet events

When a notification of a state change is emitted for an EC2 Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

```
"source": "aws.ec2fleet"  
        Identifies that the event is from EC2 Fleet.  
"detail-type": "EC2 Fleet State Change"  
        Identifies the event type.  
"detail": { "sub-type": "submitted" }  
        Identifies the event sub-type.
```

For the list of EC2 Fleet events and example event data, see [the section called “EC2 Fleet event types” \(p. 1080\)](#).

Examples

- [Create an EventBridge rule to send a notification \(p. 1089\)](#)
- [Create an EventBridge rule to trigger a Lambda function \(p. 1091\)](#)

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits an EC2 Fleet state change notification. The signal in this example is emitted as an EC2 Fleet State Change event, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when an EC2 Fleet state changes

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.

3. For **Define rule detail**, do the following:

- a. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.

- b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
- c. For **Rule type**, choose **Rule with an event pattern**.
- d. Choose **Next**.

4. For **Build event pattern**, do the following:

- a. For **Event source**, choose **AWS events or EventBridge partner events**.
- b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Fleet Instance Change event.

```
{  
  "source": ["aws.ec2fleet"],  
  "detail-type": ["EC2 Fleet Instance Change"]  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:

- A. Choose **Event pattern form**.
- B. For **Event source**, choose **AWS services**.
- C. For **AWS Service**, choose **EC2 Fleet**.
- D. For **Event type**, choose **EC2 Fleet Instance Change**.
- E. To customize the template, choose **Edit pattern** and make your changes to match the example event pattern.

- ii. (Alternative) To specify a custom event pattern, do the following:

- A. Choose **Custom pattern (JSON editor)**.
- B. In the **Event pattern** box, add the event pattern for this example.

- c. Choose **Next**.

5. For **Select target(s)**, do the following:

- a. For **Target types**, choose **AWS service**.
- b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
- c. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
- d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
- e. Choose **Next**.

6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.

7. For **Review and create**, do the following:

- a. Review the details of the rule and modify them as necessary.
- b. Choose **Create rule**.

For more information, see [Amazon EventBridge rules](#) and [Amazon EventBridge event patterns](#) in the [Amazon EventBridge User Guide](#)

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits an EC2 Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an EC2 Fleet Instance Change event, sub-type launched, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

To create the Lambda function to use in the EventBridge rule

1. Open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

For more information about using Lambda, see [Create a Lambda function with the console](#) in the [AWS Lambda Developer Guide](#).

To create an EventBridge rule to trigger a Lambda function when an instance in an EC2 Fleet changes state

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
 - a. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.
 - b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
 - c. For **Rule type**, choose **Rule with an event pattern**.
 - d. Choose **Next**.
4. For **Build event pattern**, do the following:
 - a. For **Event source**, choose **AWS events or EventBridge partner events**.
 - b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Fleet Instance Change event and launched sub-type.

```
{  
  "source": ["aws.ec2fleet"],  
  "detail-type": ["EC2 Fleet Instance Change"],  
  "detail": {  
    "sub-type": ["launched"]  
  }  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.

- C. For **AWS Service**, choose **EC2 Fleet**.
 - D. For **Event type**, choose **EC2 Fleet Instance Change**.
 - E. Choose **Edit pattern**, and add "detail": {"sub-type": ["launched"]} to match the example event pattern. For proper JSON format, insert a comma (,) after the preceding square bracket ([]).
 - ii. (Alternative) To specify a custom event pattern, do the following:
 - A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
 - c. Choose **Next**.
5. For **Select target(s)**, do the following:
 - a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.
 - d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
 6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
 7. For **Review and create**, do the following:
 - a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](#) in the *AWS Lambda Developer Guide*.

Create Amazon EventBridge rules to monitor Spot Fleet events

When a notification of a state change is emitted for a Spot Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

```
"source": "aws.ec2spotfleet"  
        Identifies that the event is from Spot Fleet.  
"detail-type": "EC2 Spot Fleet State Change"  
        Identifies the event type.  
"detail": { "sub-type": "submitted" }  
        Identifies the event sub-type.
```

For the list of Spot Fleet events and example event data, see [the section called “Spot Fleet event types” \(p. 1084\)](#).

Examples

- [Create an EventBridge rule to send a notification \(p. 1089\)](#)
- [Create an EventBridge rule to trigger a Lambda function \(p. 1091\)](#)

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits a Spot Fleet state change notification. The signal in this example is emitted as an EC2 Spot Fleet State Change event, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when a Spot Fleet state changes

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
 - a. Enter a **Name** for the rule, and, optionally, a description.
A rule can't have the same name as another rule in the same Region and on the same event bus.
 - b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
 - c. For **Rule type**, choose **Rule with an event pattern**.
 - d. Choose **Next**.
4. For **Build event pattern**, do the following:
 - a. For **Event source**, choose **AWS events or EventBridge partner events**.
 - b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Spot Fleet Instance Change event.

```
{  
  "source": ["aws.ec2spotfleet"],  
  "detail-type": ["EC2 Spot Fleet Instance Change"]  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.
 - C. For **AWS Service**, choose **EC2 Spot Fleet**.
 - D. For **Event type**, choose **EC2 Spot Fleet Instance Change**.
 - E. To customize the template, choose **Edit pattern** and make your changes to match the example event pattern.
 - ii. (Alternative) To specify a custom event pattern, do the following:
 - A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
 - c. Choose **Next**.
5. For **Select target(s)**, do the following:
 - a. For **Target types**, choose **AWS service**.

- b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
 7. For **Review and create**, do the following:
 - a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For more information, see [Amazon EventBridge rules](#) and [Amazon EventBridge event patterns](#) in the *Amazon EventBridge User Guide*

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits a Spot Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an EC2 Spot Fleet Instance Change event, sub-type launched, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

To create the Lambda function to use in the EventBridge rule

1. Open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

For more information about using Lambda, see [Create a Lambda function with the console](#) in the *AWS Lambda Developer Guide*.

To create an EventBridge rule to trigger a Lambda function when an instance in a Spot Fleet changes state

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
 - a. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.
 - b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
 - c. For **Rule type**, choose **Rule with an event pattern**.
 - d. Choose **Next**.
4. For **Build event pattern**, do the following:
 - a. For **Event source**, choose **AWS events or EventBridge partner events**.

- b. For **Event pattern**, for this example you'll specify the following event pattern to match the EC2 Spot Fleet Instance Change event and launched sub-type.

```
{  
  "source": ["aws.ec2spotfleet"],  
  "detail-type": ["EC2 Spot Fleet Instance Change"],  
  "detail": {  
    "sub-type": ["launched"]  
  }  
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

- i. To use a template to create the event pattern, do the following:
 - A. Choose **Event pattern form**.
 - B. For **Event source**, choose **AWS services**.
 - C. For **AWS Service**, choose **EC2 Spot Fleet**.
 - D. For **Event type**, choose **EC2 Spot Fleet Instance Change**.
 - E. Choose **Edit pattern**, and add "detail": {"sub-type": ["launched"]} to match the example event pattern. For proper JSON format, insert a comma (,) after the preceding square bracket ([]).
 - ii. (Alternative) To specify a custom event pattern, do the following:
 - A. Choose **Custom pattern (JSON editor)**.
 - B. In the **Event pattern** box, add the event pattern for this example.
 - c. Choose **Next**.
5. For **Select target(s)**, do the following:
- a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
 - c. For **Topic**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.
 - d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](#) (step 16) in the *Amazon EventBridge User Guide*.
 - e. Choose **Next**.
6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.
7. For **Review and create**, do the following:
- a. Review the details of the rule and modify them as necessary.
 - b. Choose **Create rule**.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](#) in the *AWS Lambda Developer Guide*.

Tutorials for EC2 Fleet and Spot Fleet

The following tutorials take you through the common processes for creating EC2 Fleets and Spot Fleets.

Tutorials

- [Tutorial: Use EC2 Fleet with instance weighting \(p. 1096\)](#)
- [Tutorial: Use EC2 Fleet with On-Demand as the primary capacity \(p. 1098\)](#)
- [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations \(p. 1099\)](#)
- [Tutorial: Use Spot Fleet with instance weighting \(p. 1104\)](#)

Tutorial: Use EC2 Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting an EC2 Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to use the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews [Spot Best Practices](#). Next, Example Corp determines the requirements for their EC2 Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their application (60 GB of RAM and eight vCPUs) as one unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their EC2 Fleet request to 20.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20

- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their EC2 Fleet request.

Price per unit hour

Example Corp uses the [On-Demand price](#) per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	\$0.7	1	\$0.7
r3.4xLarge	\$1.4	2	\$0.7
r3.8xLarge	\$2.8	4	\$0.7

Example Corp could use a global price per unit hour of \$0.7 and be competitive for all three instance types. They could also use a global price per unit hour of \$0.7 and a specific price per unit hour of \$0.9 in the r3.8xlarge launch specification.

Verify permissions

Before creating an EC2 Fleet, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [EC2 Fleet prerequisites \(p. 1007\)](#).

Create a launch template

Next, Example Corp creates a launch template. The launch template ID is used in the following step. For more information, see [Create a launch template \(p. 570\)](#).

Create the EC2 Fleet

Example Corp creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-07b3bc7625cdab851",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r3.2xlarge",  
                    "SubnetId": "subnet-482e4972",  
                    "WeightedCapacity": 1  
                },  
                {  
                    "InstanceType": "r3.4xlarge",  
                    "SubnetId": "subnet-482e4972",  
                    "WeightedCapacity": 2  
                }  
            ]  
        }  
    ]  
}
```

```
        "InstanceType": "r3.8xlarge",
        "MaxPrice": "0.90",
        "SubnetId": "subnet-482e4972",
        "WeightedCapacity": 4
    }
]
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 20,
    "DefaultTargetCapacityType": "spot"
}
}
```

Example Corp creates the EC2 Fleet using the following [create-fleet](#) command.

```
aws ec2 create-fleet \
--cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet \(p. 1013\)](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the lowest-price strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the EC2 Fleet launches either 20 r3.2xlarge instances (20 divided by 1), 10 r3.4xlarge instances (20 divided by 2), or 5 r3.8xlarge instances (20 divided by 4).

If Example Corp used the diversified strategy, the Spot Instances would come from all three pools. The EC2 Fleet would launch 6 r3.2xlarge instances (which provide 6 units), 3 r3.4xlarge instances (which provide 6 units), and 2 r3.8xlarge instances (which provide 8 units), for a total of 20 units.

Tutorial: Use EC2 Fleet with On-Demand as the primary capacity

This tutorial uses a fictitious company called ABC Online to illustrate the process of requesting an EC2 Fleet with On-Demand as the primary capacity, and Spot capacity if available.

Objective

ABC Online, a restaurant delivery company, wants to be able to provision Amazon EC2 capacity across EC2 instance types and purchasing options to achieve their desired scale, performance, and cost.

Plan

ABC Online requires a fixed capacity to operate during peak periods, but would like to benefit from increased capacity at a lower price. ABC Online determines the following requirements for their EC2 Fleet:

- On-Demand Instance capacity – ABC Online requires 15 On-Demand Instances to ensure that they can accommodate traffic at peak periods.
- Spot Instance capacity – ABC Online would like to improve performance, but at a lower price, by provisioning 5 Spot Instances.

Verify permissions

Before creating an EC2 Fleet, ABC Online verifies that it has an IAM role with the required permissions. For more information, see [EC2 Fleet prerequisites \(p. 1007\)](#).

Create a launch template

Next, ABC Online creates a launch template. The launch template ID is used in the following step. For more information, see [Create a launch template \(p. 570\)](#).

Create the EC2 Fleet

ABC Online creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-07b3bc7625cdab851",  
                "Version": "2"  
            }  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 20,  
        "OnDemandTargetCapacity": 15,  
        "DefaultTargetCapacityType": "spot"  
    }  
}
```

ABC Online creates the EC2 Fleet using the following [create-fleet](#) command.

```
aws ec2 create-fleet \  
  --cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet \(p. 1013\)](#).

Fulfillment

The allocation strategy determines that the On-Demand capacity is always fulfilled, while the balance of the target capacity is fulfilled as Spot if there is capacity and availability.

Tutorial: Launch On-Demand Instances using targeted Capacity Reservations

This tutorial walks you through all the steps that you must perform so that your EC2 Fleet launches On-Demand Instances into targeted Capacity Reservations.

You will learn how to configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances. You will also learn how to configure the fleet so that, when the total On-Demand target capacity exceeds the number of available unused Capacity Reservations, the fleet uses the specified allocation strategy for selecting the instance pools in which to launch the remaining target capacity.

EC2 Fleet configuration

In this tutorial, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (us-east-1a and us-east-1b)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

To launch On-Demand Instances into targeted Capacity Reservations, you must perform a number of steps, as follows:

- [Step 1: Create Capacity Reservations \(p. 1100\)](#)
- [Step 2: Create a Capacity Reservation resource group \(p. 1101\)](#)
- [Step 3: Add the Capacity Reservations to the Capacity Reservation resource group \(p. 1101\)](#)
- [\(Optional\) Step 4: View the Capacity Reservations in the resource group \(p. 1101\)](#)
- [Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group \(p. 1102\)](#)
- [\(Optional\) Step 6: Describe the launch template \(p. 1102\)](#)
- [Step 7: Create an EC2 Fleet \(p. 1103\)](#)
- [\(Optional\) Step 8: View the number of remaining unused Capacity Reservations \(p. 1104\)](#)

Step 1: Create Capacity Reservations

Use the [create-capacity-reservation](#) command to create the Capacity Reservations, three for us-east-1a and another three for us-east-1b. Except for the Availability Zone, the other attributes of the Capacity Reservations are identical.

3 Capacity Reservations in us-east-1a

```
aws ec2 create-capacity-reservation \
  --availability-zone us-east-1a \
  --instance-type c5.xlarge \
  --instance-platform Linux/UNIX \
  --instance-count 3 \
  --instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-1234567890abcdef1
```

3 Capacity Reservations in us-east-1b

```
aws ec2 create-capacity-reservation \
  --availability-zone us-east-1b \
  --instance-type c5.xlarge \
  --instance-platform Linux/UNIX \
  --instance-count 3 \
```

```
--instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-54321abcdef567890
```

Step 2: Create a Capacity Reservation resource group

Use the `resource-groups` service and the [create-group](#) command to create a Capacity Reservation resource group. In this example, the resource group is named `my-cr-group`. For information about why you must create a resource group, see [Use Capacity Reservations for On-Demand Instances \(p. 1000\)](#).

```
aws resource-groups create-group \
--name my-cr-group \
--configuration '[{"Type": "AWS::EC2::CapacityReservationPool"}' \
'[{"Type": "AWS::ResourceGroups::Generic", "Parameters": [{"Name": "allowed-resource-types", "Values": ["AWS::EC2::CapacityReservation"]}]}'
```

Step 3: Add the Capacity Reservations to the Capacity Reservation resource group

Use the `resource-groups` service and the [group-resources](#) command to add the Capacity Reservations that you created in Step 1 to the Capacity Reservations resource group. Note that you must reference the On-Demand Capacity Reservations by their ARNs.

```
aws resource-groups group-resources \
--group my-cr-group \
--resource-arns \
arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1 \
arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890
```

Example output

```
{  
    "Failed": [],  
    "Succeeded": [  
        "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1",  
        "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890"  
    ]  
}
```

(Optional) Step 4: View the Capacity Reservations in the resource group

Use the `resource-groups` service and the [list-group-resources](#) command to optionally describe the resource group to view its Capacity Reservations.

```
aws resource-groups list-group-resources --group my-cr-group
```

Example output

```
{  
    "ResourceIdentifiers": [  
        {  
            "Arn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1",  
            "Type": "AWS::EC2::CapacityReservation"  
        },  
        {  
            "Arn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890",  
            "Type": "AWS::ResourceGroups::Generic"  
        }  
    ]  
}
```

```
        "ResourceType": "AWS::EC2::CapacityReservation",
        "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/
cr-1234567890abcdef1"
    },
{
    "ResourceType": "AWS::EC2::CapacityReservation",
    "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/
cr-54321abcdef567890"
}
]
```

Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group

Use the [create-launch-template](#) command to create a launch template in which to specify the Capacity Reservations to use. In this example, the fleet will use targeted Capacity Reservations, which have been added to a resource group. Therefore, the launch template data specifies that the Capacity Reservation targets a specific resource group. In this example, the launch template is named `my-launch-template`.

```
aws ec2 create-launch-template \
--launch-template-name my-launch-template \
--launch-template-data \
'{ "ImageId": "ami-0123456789example", \
"CapacityReservationSpecification": \
{ "CapacityReservationTarget": \
{ "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-
east-1:123456789012:group/my-cr-group" } \
}'
```

(Optional) Step 6: Describe the launch template

Use the [describe-launch-template](#) command to optionally describe the launch template to view its configuration.

```
aws ec2 describe-launch-template-versions --launch-template-name my-launch-template
```

Example output

```
{
    "LaunchTemplateVersions": [
        {
            "LaunchTemplateId": "lt-01234567890example",
            "LaunchTemplateName": "my-launch-template",
            "VersionNumber": 1,
            "CreateTime": "2021-01-19T20:50:19.000Z",
            "CreatedBy": "arn:aws:iam::123456789012:user/Admin",
            "DefaultVersion": true,
            "LaunchTemplateData": {
                "ImageId": "ami-0947d2ba12ee1ff75",
                "CapacityReservationSpecification": {
                    "CapacityReservationTarget": {
                        "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-
east-1:123456789012:group/my-cr-group"
                    }
                }
            }
        }
    ]
}
```

]
}

Step 7: Create an EC2 Fleet

Create an EC2 Fleet that specifies the configuration information for the instances that it will launch. The following EC2 Fleet configuration shows only the pertinent configurations for this example. The launch template `my-launch-template` is the launch template you created in Step 5. There are two instance pools, each with the same instance type (`c5.xlarge`), but with different Availability Zones (`us-east-1a` and `us-east-1b`). The price of the instance pools is the same because pricing is defined for the Region, not per Availability Zone. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

Note

The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1a"  
                },  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1b"  
                }  
            ]  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 10,  
        "DefaultTargetCapacityType": "on-demand"  
    },  
    "OnDemandOptions": {  
        "AllocationStrategy": "lowest-price",  
        "CapacityReservationOptions": {  
            "UsageStrategy": "use-capacity-reservations-first"  
        }  
    },  
    "Type": "instant"  
}
```

After you create the `instant` fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
 - 3 On-Demand Instances are launched into the 3 `c5.xlarge` targeted Capacity Reservations in `us-east-1a`
 - 3 On-Demand Instances are launched into the 3 `c5.xlarge` targeted Capacity Reservations in `us-east-1b`
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is `lowest-price` in this example.

However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

(Optional) Step 8: View the number of remaining unused Capacity Reservations

After the fleet is launched, you can optionally run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{ "CapacityReservationId": "cr-111",
  "InstanceType": "c5.xlarge",
  "AvailableInstanceCount": 0
}

{ "CapacityReservationId": "cr-222",
  "InstanceType": "c5.xlarge",
  "AvailableInstanceCount": 0
}
```

Tutorial: Use Spot Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting a Spot Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to leverage the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews [Spot Best Practices](#). Next, Example Corp determines the following requirements for their Spot Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their

application (60 GB of RAM and eight vCPUs) as 1 unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their Spot Fleet request to 20.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their Spot Fleet request.

Price per unit hour

Example Corp uses the [On-Demand price](#) per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	\$0.7	1	\$0.7
r3.4xLarge	\$1.4	2	\$0.7
r3.8xLarge	\$2.8	4	\$0.7

Example Corp could use a global price per unit hour of \$0.7 and be competitive for all three instance types. They could also use a global price per unit hour of \$0.7 and a specific price per unit hour of \$0.9 in the r3.8xlarge launch specification.

Verify permissions

Before creating a Spot Fleet request, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [Spot Fleet permissions \(p. 1052\)](#).

Create the request

Example Corp creates a file, config.json, with the following configuration for its Spot Fleet request:

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "SubnetId": "subnet-482e4972",  
            "WeightedCapacity": 1  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.4xlarge",  
            "SubnetId": "subnet-482e4972",  
            "WeightedCapacity": 2  
        }  
    ]  
}
```

```
        "SubnetId": "subnet-482e4972",
        "WeightedCapacity": 2
    },
    [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.8xlarge",
            "SubnetId": "subnet-482e4972",
            "SpotPrice": "0.90",
            "WeightedCapacity": 4
        }
    ]
}
```

Example Corp creates the Spot Fleet request using the [request-spot-fleet](#) command.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For more information, see [Spot Fleet request types \(p. 1025\)](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the `lowestPrice` strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the Spot Fleet launches either 20 `r3.2xlarge` instances (20 divided by 1), 10 `r3.4xlarge` instances (20 divided by 2), or 5 `r3.8xlarge` instances (20 divided by 4).

If Example Corp used the `diversified` strategy, the Spot Instances would come from all three pools. The Spot Fleet would launch 6 `r3.2xlarge` instances (which provide 6 units), 3 `r3.4xlarge` instances (which provide 6 units), and 2 `r3.8xlarge` instances (which provide 8 units), for a total of 20 units.

Example configurations for EC2 Fleet and Spot Fleet

The following examples show launch configurations that you can use to create EC2 Fleets and Spot Fleets.

Topics

- [EC2 Fleet example configurations \(p. 1106\)](#)
- [Spot Fleet example configurations \(p. 1121\)](#)

EC2 Fleet example configurations

The following examples show launch configurations that you can use with the `create-fleet` command to create an EC2 Fleet. For more information about the parameters, see [create-fleet](#) in the *AWS CLI Command Reference*.

Examples

- [Example 1: Launch Spot Instances as the default purchasing option \(p. 1107\)](#)
- [Example 2: Launch On-Demand Instances as the default purchasing option \(p. 1107\)](#)
- [Example 3: Launch On-Demand Instances as the primary capacity \(p. 1108\)](#)
- [Example 4: Launch Spot Instances using the lowest-price allocation strategy \(p. 1108\)](#)

- [Example 5: Launch On-Demand Instances using multiple Capacity Reservations \(p. 1109\)](#)
- [Example 6: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations \(p. 1111\)](#)
- [Example 7: Launch On-Demand Instances using targeted Capacity Reservations \(p. 1114\)](#)
- [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances \(p. 1116\)](#)
- [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 1117\)](#)
- [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 1118\)](#)
- [Example 11: Launch Spot Instances in a price-capacity-optimized fleet \(p. 1119\)](#)
- [Example 12: Configure attribute-based instance type selection \(p. 1120\)](#)

Example 1: Launch Spot Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is spot, which results in the fleet launching 2 Spot Instances.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "DefaultTargetCapacityType": "spot"  
            }  
        }  
    ]  
}
```

Example 2: Launch On-Demand Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is on-demand, which results in the fleet launching 2 On-Demand Instances.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "DefaultTargetCapacityType": "on-demand"  
            }  
        }  
    ]  
}
```

}

Example 3: Launch On-Demand Instances as the primary capacity

The following example specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing option is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfill the total target capacity. The purchasing option for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {"TargetCapacitySpecification": {  
            "TotalTargetCapacity": 2,  
            "OnDemandTargetCapacity": 1,  
            "DefaultTargetCapacityType": "spot"  
        }  
    ]  
}
```

Example 4: Launch Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is `lowest-price`, is used. The following example uses the `lowest-price` allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing option is spot. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        }  
    ],  
    "Overrides": [  
        {  
            "InstanceType": "c4.large",  
            "WeightedCapacity": 1,  
            "SubnetId": "subnet-a4f6c5d3"  
        },  
        {  
            "InstanceType": "c3.large",  
            "WeightedCapacity": 1,  
            "SubnetId": "subnet-a4f6c5d3"  
        },  
        {  
            "InstanceType": "c5.large",  
            "WeightedCapacity": 1,  
            "SubnetId": "subnet-a4f6c5d3"  
        }  
    ]  
}
```

```
        "WeightedCapacity": 1,  
        "SubnetId": "subnet-a4f6c5d3"  
    }  
]  
}  
],  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 2,  
    "DefaultTargetCapacityType": "spot"  
}  
}
```

Example 5: Launch On-Demand Instances using multiple Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the Capacity Reservations to use when there are more Capacity Reservations than are needed to fulfil the target capacity.

In this example, the fleet configuration is as follows:

- Target capacity: 12 On-Demand Instances
- Total unused Capacity Reservations: 15 (more than the fleet's target capacity of 12 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (`m5.large`, `m4.xlarge`, and `m4.2xlarge`)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: `lowest-price` (When there are multiple unused Capacity Reservations in multiple instance pools, the fleet determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

```
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 12, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – \$0.096 per hour
- m4.xlarge – \$0.20 per hour
- m4.2xlarge – \$0.40 per hour

Note

The fleet type must be of type instant. Other fleet types do not support use-capacity-reservations-first.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-abc1234567example",  
                "Version": "1"  
            }  
            "Overrides": [  
                {  
                    "InstanceType": "m5.large",  
                    "AvailabilityZone": "us-east-1a",  
                    "WeightedCapacity": 1  
                },  
                {  
                    "InstanceType": "m4.xlarge",  
                    "AvailabilityZone": "us-east-1a",  
                    "WeightedCapacity": 1  
                },  
                {  
                    "InstanceType": "m4.2xlarge",  
                    "AvailabilityZone": "us-east-1a",  
                    "WeightedCapacity": 1  
                }  
            ]  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 12,  
        "DefaultTargetCapacityType": "on-demand"  
    },  
    "OnDemandOptions": {  
        "AllocationStrategy": "lowest-price"  
        "CapacityReservationOptions": {  
            "UsageStrategy": "use-capacity-reservations-first"  
        }  
    }  
}
```

```
        "UsageStrategy": "use-capacity-reservations-first"
    },
},
"Type": "instant",
}
```

After you create the instant fleet using the preceding configuration, the following 12 instances are launched to meet the target capacity:

- 5 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is the lowest price, and there are 5 available unused m5.large Capacity Reservations
- 5 m4.xlarge On-Demand Instances in us-east-1a – m4.xlarge in us-east-1a is the next lowest price, and there are 5 available unused m4.xlarge Capacity Reservations
- 2 m4.2xlarge On-Demand Instances in us-east-1a – m4.2xlarge in us-east-1a is the third lowest price, and there are 5 available unused m4.2xlarge Capacity Reservations of which only 2 are needed to meet the target capacity

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the m5.large and m4.xlarge Capacity Reservations were used, with 3 m4.2xlarge Capacity Reservations remaining unused.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 3
}
```

Example 6: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to use-capacity-reservations-first. This example demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 16 On-Demand Instances
- Total unused Capacity Reservations: 15 (less than the fleet's target capacity of 16 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (m5.large, m4.xlarge, and m4.2xlarge)

- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: lowest-price (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 16, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – \$0.096 per hour
- m4.xlarge – \$0.20 per hour
- m4.2xlarge – \$0.40 per hour

Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        },
        "Overrides": [
            {
                "InstanceType": "m5.large",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            },
            {
                "InstanceType": "m4.xlarge",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            },
            {
                "InstanceType": "m4.2xlarge",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            }
        ]
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 16,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price"
    },
    "Type": "instant",
}
}
```

After you create the instant fleet using the preceding configuration, the following 16 instances are launched to meet the target capacity:

- 6 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is the lowest price, and there are 5 available unused m5.large Capacity Reservations. The Capacity Reservations are used first to launch 5 On-Demand Instances. After the remaining m4.xlarge and m4.2xlarge Capacity Reservations are used, to meet the target capacity an additional On-Demand Instance is launched according to the On-Demand allocation strategy, which is lowest-price in this example.
- 5 m4.xlarge On-Demand Instances in us-east-1a – m4.xlarge in us-east-1a is the next lowest price, and there are 5 available unused m4.xlarge Capacity Reservations
- 5 m4.2xlarge On-Demand Instances in us-east-1a – m4.2xlarge in us-east-1a is the third lowest price, and there are 5 available unused m4.2xlarge Capacity Reservations

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
}
```

```
        "AvailableInstanceCount": 0
    }

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 0
}
```

Example 7: Launch On-Demand Instances using targeted Capacity Reservations

You can configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how to launch On-Demand Instances into targeted Capacity Reservations, where the attributes of the Capacity Reservations are the same except for their Availability Zones (`us-east-1a` and `us-east-1b`). It also demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (`us-east-1a` and `us-east-1b`)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

For a walkthrough of the procedures that you must perform to accomplish this example, see [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations \(p. 1099\)](#).

Capacity Reservations

The account has the following 6 unused Capacity Reservations in 2 different pools. In this example, the pools differ by their Availability Zones. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "c5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

```
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1b",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price for c5.xlarge in us-east-1 is \$0.17 per hour.

Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1a"
                },
                {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1b"
                }
            ]
        },
        {
            "TargetCapacitySpecification": {
                "TotalTargetCapacity": 10,
                "DefaultTargetCapacityType": "on-demand"
            },
            "OnDemandOptions": {
                "AllocationStrategy": "lowest-price",
                "CapacityReservationOptions": {
                    "UsageStrategy": "use-capacity-reservations-first"
                }
            },
            "Type": "instant"
        }
    ]
}
```

After you create the instant fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
 - 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1a

- 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1b
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is lowest-price in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "c5.xlarge",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "c5.xlarge",  
    "AvailableInstanceCount": 0  
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from when the new replacement Spot Instances are launched to when the old Spot Instances are automatically deleted, for `termination-delay`, specify a value in seconds. For more information, see [Configuration options \(p. 1001\)](#).

Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete so that the old instances are only terminated after these procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the EC2 Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacity-optimized`. For more information about what you should consider when configuring an EC2 Fleet for Capacity Rebalancing, see [Capacity Rebalancing \(p. 1001\)](#).

```
{  
    "ExcessCapacityTerminationPolicy": "termination",  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "LaunchTemplate",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c3.large",  
                    "WeightedCapacity": 1,  
                    "Placement": {  
                        "AvailabilityZone": "us-east-1b"  
                    }  
                }  
            ]  
        }  
    ]  
}
```

```
        "AvailabilityZone": "us-east-1a"
    }
},
{
    "InstanceType": "c4.large",

        }
    }
}
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set AllocationStrategy to capacity-optimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                    "Placement": {
                        "AvailabilityZone": "us-west-2a"
                    }
                },
                {

```

```
        "InstanceType": "m4.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        },
    },
    {
        "InstanceType": "c5.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    }
]
},
{
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 50,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the capacity-optimized-prioritized allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacity-optimized-prioritized`. EC2 Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized-prioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                    "Priority": 1,
                    "Placement": {
                        "AvailabilityZone": "us-west-2a"
                    },
                },
            ]
        }
    ]
}
```

```
{  
    "InstanceType": "m4.2xlarge",  
    "Priority": 2,  
    "Placement": {  
        "AvailabilityZone": "us-west-2b"  
    },  
    {  
        "InstanceType": "c5.2xlarge",  
        "Priority": 3,  
        "Placement": {  
            "AvailabilityZone": "us-west-2b"  
        }  
    }  
},  
]  
],  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 50,  
    "DefaultTargetCapacityType": "spot"  
}
```

Example 11: Launch Spot Instances in a price-capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot AllocationStrategy to `price-capacity-optimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "price-capacity-optimized",  
        "MinTargetCapacity": 2,  
        "SingleInstanceType": true  
    },  
    "OnDemandOptions": {  
        "AllocationStrategy": "lowest-price"  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2a"  
                    },  
                    {  
                        "InstanceType": "m4.2xlarge",  
                        "Placement": {  
                            "AvailabilityZone": "us-west-2b"  
                        },  
                    },  
                ],  
            ]  
        }  
    ]  
}
```

```
{  
    "InstanceType": "c5.2xlarge",  
    "Placement": {  
        "AvailabilityZone": "us-west-2b"  
    }  
},  
]  
,  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 50,  
    "OnDemandTargetCapacity": 0,  
    "SpotTargetCapacity": 50,  
    "DefaultTargetCapacityType": "spot"  
},  
"Type": "instant"  
}
```

Example 12: Configure attribute-based instance type selection

The following example demonstrates how to configure an EC2 Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [EC2 Fleet provisions the fleet \(p. 988\)](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "price-capacity-optimized"  
    },  
    "LaunchTemplateConfigs": [{  
        "LaunchTemplateSpecification": {  
            "LaunchTemplateName": "my-launch-template",  
            "Version": "1"  
        },  
        "Overrides": [{  
            "InstanceRequirements": {  
                "VCpuCount": {  
                    "Min": 2  
                },  
                "MemoryMiB": {  
                    "Min": 4  
                }  
            }  
        }]  
    }],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 20,  
        "DefaultTargetCapacityType": "spot"  
    }  
}
```

```
},  
    "Type": "instant"  
}
```

Spot Fleet example configurations

The following examples show launch configurations that you can use with the [request-spot-fleet](#) command to create a Spot Fleet request. For more information, see [Create a Spot Fleet request \(p. 1058\)](#).

Note

For Spot Fleet, you can't specify a network interface ID in a launch template or launch specification. Make sure you omit the NetworkInterfaceID parameter in your launch template or launch specification.

Examples

- [Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region \(p. 1121\)](#)
- [Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list \(p. 1122\)](#)
- [Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list \(p. 1123\)](#)
- [Example 4. Override the price for the request \(p. 1124\)](#)
- [Example 5: Launch a Spot Fleet using the diversified allocation strategy \(p. 1125\)](#)
- [Example 6: Launch a Spot Fleet using instance weighting \(p. 1127\)](#)
- [Example 7: Launch a Spot Fleet with On-Demand capacity \(p. 1128\)](#)
- [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances \(p. 1129\)](#)
- [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 1130\)](#)
- [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 1131\)](#)
- [Example 11: Launch Spot Instances in a priceCapacityOptimized fleet \(p. 1132\)](#)
- [Example 12: Configure attribute-based instance type selection \(p. 1132\)](#)

Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region

The following example specifies a single launch specification without an Availability Zone or subnet. The Spot Fleet launches the instances in the lowest-priced Availability Zone that has a default subnet. The price you pay does not exceed the On-Demand price.

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "KeyName": "my-key-pair",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "m3.medium",  
            "IamInstanceProfile": {  
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"  
            }  
        }  
    ]  
}
```

```
    ]  
}
```

Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list

The following examples specify two launch specifications with different Availability Zones or subnets, but the same instance type and AMI.

Availability Zones

The Spot Fleet launches the instances in the default subnet of the lowest-priced Availability Zone that you specified.

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "KeyName": "my-key-pair",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "m3.medium",  
            "Placement": {  
                "AvailabilityZone": "us-west-2a, us-west-2b"  
            },  
            "IamInstanceProfile": {  
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"  
            }  
        }  
    ]  
}
```

Subnets

You can specify default subnets or nondefault subnets, and the nondefault subnets can be from a default VPC or a nondefault VPC. The Spot service launches the instances in whichever subnet is in the lowest-priced Availability Zone.

You can't specify different subnets from the same Availability Zone in a Spot Fleet request.

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "KeyName": "my-key-pair",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "m3.medium",  
            "SubnetId": "subnet-a61dafcf, subnet-65ea5f08",  
            "IamInstanceProfile": {  
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"  
            }  
        }  
    ]  
}
```

```
        ]  
    }  
}
```

If the instances are launched in a default VPC, they receive a public IPv4 address by default. If the instances are launched in a nondefault VPC, they do not receive a public IPv4 address by default. Use a network interface in the launch specification to assign a public IPv4 address to instances launched in a nondefault VPC. When you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```
...  
{  
    "ImageId": "ami-1a2b3c4d",  
    "KeyName": "my-key-pair",  
    "InstanceType": "m3.medium",  
    "NetworkInterfaces": [  
        {  
            "DeviceIndex": 0,  
            "SubnetId": "subnet-1a2b3c4d",  
            "Groups": [ "sg-1a2b3c4d" ],  
            "AssociatePublicIpAddress": true  
        }  
    ],  
    "IamInstanceProfile": {  
        "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"  
    }  
}  
...
```

Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list

The following examples specify two launch configurations with different instance types, but the same AMI and Availability Zone or subnet. The Spot Fleet launches the instances using the specified instance type with the lowest price.

Availability Zone

```
{  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "c5.4xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "SecurityGroups": [  
                {  
                    "GroupId": "sg-1a2b3c4d"  
                }  
            ],  
            "InstanceType": "t2.micro",  
            "Placement": {  
                "AvailabilityZone": "us-west-2a"  
            }  
        }  
    ]  
}
```

```
        "InstanceType": "r3.8xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    ],
}
}
```

Subnet

```
{
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "c5.4xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "r3.8xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}
```

Example 4. Override the price for the request

We recommend that you use the default maximum price, which is the On-Demand price. If you prefer, you can specify a maximum price for the fleet request and maximum prices for individual launch specifications.

The following examples specify a maximum price for the fleet request and maximum prices for two of the three launch specifications. The maximum price for the fleet request is used for any launch specification that does not specify a maximum price. The Spot Fleet launches the instances using the instance type with the lowest price.

Availability Zone

```
{
    "SpotPrice": "1.00",
    "TargetCapacity": 30,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c3.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            },
            "SpotPrice": "0.10"
        }
    ]
}
```

```
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c3.4xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            },
            "SpotPrice": "0.20"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c3.8xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        }
    ]
}
```

Subnet

```
{
    "SpotPrice": "1.00",
    "TargetCapacity": 30,

        }
    ]
}
```

Example 5: Launch a Spot Fleet using the diversified allocation strategy

The following example uses the diversified allocation strategy. The launch specifications have different instance types but the same AMI and Availability Zone or subnet. The Spot Fleet distributes the 30 instances across the three launch specifications, such that there are 10 instances of each type. For more information, see [Allocation strategies for Spot Instances \(p. 1027\)](#).

Availability Zone

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
```

```

"LaunchSpecifications": [
    {

        "InstanceType": "c4.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "m3.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "r3.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    }
]
}

```

Subnet

```

{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}

```

A best practice to increase the chance that a spot request can be fulfilled by EC2 capacity in the event of an outage in one of the Availability Zones is to diversify across zones. For this scenario, include each Availability Zone available to you in the launch specification. And, instead of using the same subnet each time, use three unique subnets (each mapping to a different zone).

Availability Zone

```

{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
}

```

```

"LaunchSpecifications": [
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "c4.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2a"
        }
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "m3.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "r3.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2c"
        }
    }
]
}

```

Subnet

```

{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-2a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-3a2b3c4d"
        }
    ]
}

```

Example 6: Launch a Spot Fleet using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight. The Spot Fleet selects the instance type with the lowest price per unit hour. The Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity.

If the `r3.2xlarge` request is successful, Spot provisions 4 of these instances. Divide 20 by 6 for a total of 3.33 instances, then round up to 4 instances.

If the `c3.xlarge` request is successful, Spot provisions 7 of these instances. Divide 20 by 3 for a total of 6.66 instances, then round up to 7 instances.

For more information, see [Spot Fleet instance weighting \(p. 1048\)](#).

Availability Zone

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "WeightedCapacity": 6  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "WeightedCapacity": 3  
        }  
    ]  
}
```

Subnet

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "SubnetId": "subnet-1a2b3c4d",  
            "WeightedCapacity": 6  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.xlarge",  
            "SubnetId": "subnet-1a2b3c4d",  
            "WeightedCapacity": 3  
        }  
    ]  
}
```

Example 7: Launch a Spot Fleet with On-Demand capacity

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. If there is capacity, the On-Demand request is always fulfilled. The balance of the target capacity is fulfilled as Spot if there is capacity and availability.

The following example specifies the desired target capacity as 10, of which 5 must be On-Demand capacity. Spot capacity is not specified; it is implied in the balance of the target capacity minus the On-

Demand capacity. Amazon EC2 launches 5 capacity units as On-Demand, and 5 capacity units (10-5=5) as Spot if there is available Amazon EC2 capacity and availability.

For more information, see [On-Demand in Spot Fleet \(p. 1044\)](#).

```
{  
    "IamFleetRole": "arn:aws:iam::781603563322:role/aws-ec2-spot-fleet-tagging-role",  
    "AllocationStrategy": "lowestPrice",  
    "TargetCapacity": 10,  
    "SpotPrice": null,  
    "ValidFrom": "2018-04-04T15:58:13Z",  
    "ValidUntil": "2019-04-04T15:58:13Z",  
    "TerminateInstancesWithExpiration": true,  
    "LaunchSpecifications": [],  
    "Type": "maintain",  
    "OnDemandTargetCapacity": 5,  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0dbb04d4a6cca5ad1",  
                "Version": "2"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "t2.medium",  
                    "WeightedCapacity": 1,  
                    "SubnetId": "subnet-d0dc51fb"  
                }  
            ]  
        }  
    ]  
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from the launch of the new replacement Spot Instances to the automatic deletion of the old Spot Instances, for `termination-delay`, specify a value in seconds. For more information, see [Configuration options \(p. 1045\)](#).

Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This ensures that the old instances are terminated only after the shutdown procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the Spot Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacityOptimized`. For more information about what you should consider when configuring a Spot Fleet for Capacity Rebalancing, see [Capacity Rebalancing \(p. 1044\)](#).

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimized",

    "CapacityRebalance": {  
        "ReplacementStrategy": "launch-before-terminate",  
        "TerminationDelay": "720"  
    }  
}  
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set AllocationStrategy to capacityOptimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{  
    "TargetCapacity": "50",  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimized",  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                }  
            ]  
        }  
    ]  
}
```

```
        "AvailabilityZone": "us-west-2a"
    },
    {
        "InstanceType": "m4.2xlarge",
        "AvailabilityZone": "us-west-2b"
    },
    {
        "InstanceType": "c5.2xlarge",
        "AvailabilityZone": "us-west-2b"
    }
]
}
]
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the `capacityOptimizedPrioritized` allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacityOptimizedPrioritized`. Spot Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{
    "TargetCapacity": "50",
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "capacityOptimizedPrioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                    "PriorityPriority
```

```
        "Priority": 3,
        "AvailabilityZone": "us-west-2b"
    }
}
}
```

Example 11: Launch Spot Instances in a `priceCapacityOptimized` fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot AllocationStrategy to `priceCapacityOptimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "OnDemandAllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::111111111111:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateId": "lt-0123456789example",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceType": "r4.2xlarge",
                        "AvailabilityZone": "us-west-2a"
                    },
                    {
                        "InstanceType": "m4.2xlarge",
                        "AvailabilityZone": "us-west-2b"
                    },
                    {
                        "InstanceType": "c5.2xlarge",
                        "AvailabilityZone": "us-west-2b"
                    }
                ]
            },
            "TargetCapacity": 50,
            "Type": "request"
        ]
    }
}
```

Example 12: Configure attribute-based instance type selection

The following example demonstrates how to configure a Spot Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- VCpuCount – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- MemoryMiB – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when [Spot Fleet provisions the fleet \(p. 1031\)](#).

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

```
{  
    "AllocationStrategy": "priceCapacityOptimized",  
    "TargetCapacity": 20,  
    "Type": "request",  
    "LaunchTemplateConfigs": [{  
        "LaunchTemplateSpecification": {  
            "LaunchTemplateName": "my-launch-template",  
            "Version": "1"  
        },  
        "Overrides": [{  
            "InstanceRequirements": {  
                "VCpuCount": {  
                    "Min": 2  
                },  
                "MemoryMiB": {  
                    "Min": 4  
                }  
            }  
        }]  
    }]  
}
```

Fleet quotas

The usual Amazon EC2 quotas (formerly referred to as limits) apply to instances launched by an EC2 Fleet or a Spot Fleet, such as [Spot Instance limits \(p. 456\)](#) and [volume limits \(p. 2019\)](#).

In addition, the following quotas apply:

Quota description	Quota
The number of EC2 Fleets and Spot Fleets per Region in the active, deleted_running, and cancelled_running states	1,000 ^{1 2 3 4}
The number of Spot capacity pools (unique combination of instance type and subnet)	300 ^{1 4}
The size of the user data in a launch specification	16 KB ²
The target capacity per EC2 Fleet or Spot Fleet	10,000
The target capacity across all EC2 Fleets and Spot Fleets in a Region	100,000 ¹

Quota description	Quota
An EC2 Fleet request or a Spot Fleet request can't span Regions.	
An EC2 Fleet request or a Spot Fleet request can't span different subnets from the same Availability Zone.	

¹ These quotas apply to both your EC2 Fleets and your Spot Fleets.

² These are hard quotas. You cannot request an increase for these quotas.

³ After you delete an EC2 Fleet or cancel a Spot Fleet request, and if you specified that the fleet should *not* terminate its Spot Instances when you deleted or canceled the request, the fleet request enters the `deleted_running` (EC2 Fleet) or `cancelled_running` (Spot Fleet) state and the instances continue to run until they are interrupted or you terminate them manually. If you terminate the instances, the fleet request enters the `deleted_terminating` (EC2 Fleet) or `cancelled_terminating` (Spot Fleet) state and does not count towards this quota. For more information, see [Delete an EC2 Fleet \(p. 1021\)](#) and [Cancel a Spot Fleet request \(p. 1070\)](#).

⁴ This quota only applies to fleets of type `request` or `maintain`. This quota does not apply to instant fleets.

Request a quota increase for target capacity

If you need more than the default quota for target capacity, you can request a quota increase.

To request a quota increase for target capacity

1. Open the AWS Support Center [Create case](#) form.
2. Choose **Service limit increase**.
3. For **Limit type**, choose **EC2 Fleet**.
4. For **Region**, choose the AWS Region in which to request the quota increase.
5. For **Limit**, choose **Target Fleet Capacity per Fleet (in units)** or **Target Fleet Capacity per Region (in units)**, depending on which quota you want to increase.
6. For **New limit value**, enter the new quota value.
7. To request an increase for another quota, choose **Add another request**, and repeat Steps 4–6.
8. For **Use case description**, enter your reason for requesting a quota increase.
9. Under **Contact options**, specify your preferred contact language and contact method.
10. Choose **Submit**.

Amazon Elastic Graphics

Amazon Elastic Graphics provides flexible, low-cost, and high performance graphics acceleration for your Windows instances. Elastic Graphics accelerators come in multiple sizes and are a low-cost alternative to using GPU graphics instance types (such as G2 and G3). You have the flexibility to choose an instance type that meets the compute, memory, and storage needs of your application. Then, choose the accelerator for your instance that meets the graphics requirements of your workload.

Elastic Graphics is suited for applications that require a small or intermittent amount of additional graphics acceleration, and that use OpenGL graphics support. If you need access to full, directly attached GPUs and use of DirectX, CUDA, or Open Computing Language (OpenCL) parallel computing frameworks, use an accelerated computing instance type instance instead. For more information, see [Windows accelerated computing instances \(p. 321\)](#).

Contents

- [Elastic Graphics basics \(p. 1135\)](#)
- [Pricing for Elastic Graphics \(p. 1137\)](#)
- [Elastic Graphics limitations \(p. 1137\)](#)
- [Work with Elastic Graphics \(p. 1137\)](#)
- [Elastic Graphics maintenance \(p. 1143\)](#)
- [Use CloudWatch metrics to monitor Elastic Graphics \(p. 1144\)](#)
- [Troubleshoot \(p. 1146\)](#)

Elastic Graphics basics

To use Elastic Graphics, launch a Windows instance and specify an accelerator type for the instance during launch. AWS finds available Elastic Graphics capacity and establishes a network connection between your instance and the Elastic Graphics accelerator.

Note

Bare metal instances are not supported.

Elastic Graphics accelerators are available in the following AWS Regions: us-east-1, us-east-2, us-west-2, ap-northeast-1, ap-southeast-1, ap-southeast-2, eu-central-1, and eu-west-1.

The following instance types support Elastic Graphics accelerators:

- **General purpose:** M3, M4, M5, M5d, M5dn, M5n, T2, and T3

Note

Only t2.medium and larger and t3.medium and larger are supported.

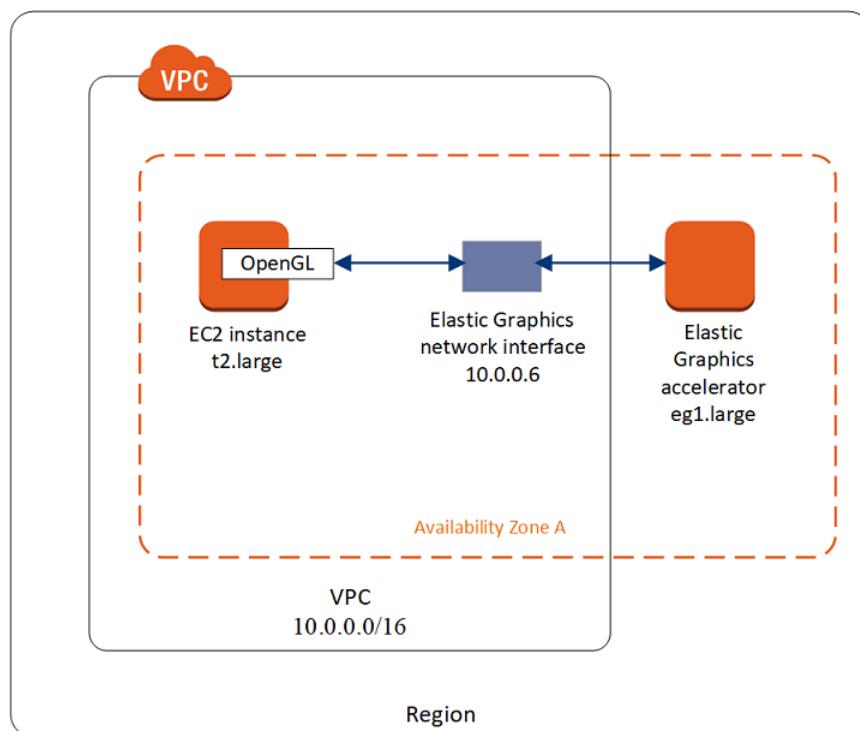

- **Compute optimized:** C3, C4, C5, C5a, C5ad, C5d, and C5n
- **Memory optimized:** R3, R4, R5, R5d, R5dn, R5n, X1, X1e, and z1d
- **Storage optimized:** D2, D3, D3en, H1, I3, and I3en
- **Accelerated computing:** P2, P3, and P3dn

The following Elastic Graphics accelerators are available. You can attach any Elastic Graphics accelerator to any supported instance type.

Elastic Graphics accelerator	Graphics memory (GB)
eg1.medium	1
eg1.large	2
eg1.xlarge	4
eg1.2xlarge	8

An Elastic Graphics accelerator does not form part of the hardware of your instance. Instead, it is network-attached through a network interface, known as the *Elastic Graphics network interface*. When you launch or restart an instance with graphics acceleration, the Elastic Graphics network interface is created in your VPC for you.

The Elastic Graphics network interface is created in the same subnet and VPC as your instance and is assigned a private IPv4 address from that subnet. The accelerator attached to your Amazon EC2 instance is allocated from a pool of available accelerators in the same Availability Zone as your instance.

Elastic Graphics accelerators support the API standards for OpenGL 4.3 API and earlier, which can be used for batch applications or 3D-graphics acceleration. An Amazon-optimized OpenGL library on your instance detects the attached accelerator. It directs OpenGL API calls from your instance to the accelerator, which then processes the requests and returns the results. Traffic between the instance and the accelerator uses the same bandwidth as the instance's network traffic so we recommend that you have adequate network bandwidth available. Consult your software vendor for any OpenGL compliance and version questions.

By default, the default security group for your VPC is associated with the Elastic Graphics network interface. The Elastic Graphics network traffic uses the TCP protocol and port 2007. Ensure that the security group for your instance allows for this. For more information, see [Configure your security groups \(p. 1138\)](#).

Pricing for Elastic Graphics

You are charged for each second that an Elastic Graphics accelerator is attached to an instance in the running state when the accelerator is in the Ok state. You are not charged for an accelerator attached to an instance that is in the pending, stopping, stopped, shutting-down, or terminated state. You are also not charged when an accelerator is in the Unknown or Impaired state.

Pricing for accelerators is available at On-Demand rates only. You can attach an accelerator to a Reserved Instance or Spot Instance, however, the On-Demand price for the accelerator applies.

For more information, see [Amazon Elastic Graphics Pricing](#).

Elastic Graphics limitations

Before you start using Elastic Graphics accelerators, be aware of the following limitations:

- You can attach accelerators only to Windows instances with Microsoft Windows Server 2012 R2 or later. Linux instances are currently not supported.
- You can attach one accelerator to an instance at a time.
- You can attach an accelerator only during instance launch. You cannot attach an accelerator to an existing instance.
- You can't hibernate an instance with an attached accelerator.
- You can't share an accelerator between instances.
- You can't detach an accelerator from an instance or transfer it to another instance. If you no longer require an accelerator, you must terminate your instance. To change the accelerator type, create an AMI from your instance, terminate the instance, and launch a new instance with a different accelerator specification.
- The only supported versions of the OpenGL API are 4.3 and earlier. DirectX, CUDA, and OpenCL are not supported.
- The Elastic Graphics accelerator is not visible or accessible through the device manager of your instance.
- You can't reserve or schedule accelerator capacity.

Work with Elastic Graphics

You can launch an instance and associate it with an Elastic Graphics accelerator during launch. You must then manually install the necessary libraries on your instance that enable communication with the accelerator. For limitations, see [Elastic Graphics limitations \(p. 1137\)](#).

Tasks

- [Configure your security groups \(p. 1138\)](#)
- [Launch an instance with an Elastic Graphics accelerator \(p. 1139\)](#)
- [Install the required software for Elastic Graphics \(p. 1139\)](#)
- [Verify Elastic Graphics functionality on your instance \(p. 1140\)](#)
- [View Elastic Graphics information \(p. 1142\)](#)

- [Submit feedback \(p. 1142\)](#)

Configure your security groups

Elastic Graphics requires a self-referencing security group that allows inbound and outbound traffic to and from the security group itself. The security group must include the following inbound and outbound rules.

Inbound

Type	Protocol	Port	Source
Elastic Graphics	TCP	2007	The security group ID (its own resource ID)

Outbound

Type	Protocol	Port range	Destination
Elastic Graphics	TCP	2007	The security group ID (its own resource ID)

If you use the Amazon EC2 console to launch your instance with an Elastic Graphics accelerator, you can either allow the launch instance wizard to automatically create the required security group rules, or you can select a security that you created previously.

If you are launching your instance using the AWS CLI or an SDK, you must specify a security group that you created previously.

To create a security group for Elastic Graphics

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
 - a. For **Security group name**, enter a descriptive name for the security group, such as **Elastic Graphics security group**.
 - b. (Optional) For **Description**, enter a brief description of the security group.
 - c. For **VPC**, select the VPC into which you intend to use Elastic Graphics.
 - d. Choose **Create security group**.
4. In the navigation pane, choose **Security Groups**, select the security group that you just created, and on the **Details** tab, copy the **Security group ID**.
5. On the **Inbound rules** tab, choose **Edit inbound rules** and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **Elastic Graphics**.
 - c. For **Source type**, choose **Custom**.
 - d. For **Source**, paste the security group ID that you copied previously.
 - e. Choose **Save rules**.
6. On the **Outbound rules** tab, choose **Edit outbound rules** and then do the following:
 - a. Choose **Add rule**.

- b. For **Type**, choose **Elastic Graphics**.
- c. For **Destination type**, choose **Custom**.
- d. For **Destination**, paste the security group ID that you copied previously.
- e. Choose **Save rules**.

For more information, see [Amazon EC2 security groups for Windows instances \(p. 1674\)](#).

Launch an instance with an Elastic Graphics accelerator

You can associate an Elastic Graphics accelerator to an instance during launch. If the launch fails, the following are possible reasons:

- Insufficient Elastic Graphics accelerator capacity
- Exceeded limit on Elastic Graphics accelerators in the Region
- Not enough private IPv4 addresses in your VPC to create a network interface for the accelerator

For more information, see [Elastic Graphics limitations \(p. 1137\)](#).

To associate an Elastic Graphics accelerator during instance launch (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the dashboard, choose **Launch Instance**.
3. Select a Windows AMI and a supported instance type. For more information, see [Elastic Graphics basics \(p. 1135\)](#).
4. On the **Configure Instance Details** page, select a VPC and subnet in which to launch your instance.
5. Choose **Add Graphics Acceleration**, and select an Elastic Graphics accelerator type.
6. (Optional) On the **Add Storage** and **Add Tags** pages, add volumes and tags as needed.
7. On the **Configure Security Group** page, you can let the console create a security group for you with the required inbound and outbound rules, or you can use the security group that you created manually in [Configure your security groups \(p. 1138\)](#). Add additional security groups as needed.
8. Choose **Review and Launch** to review your instance options and then choose **Launch**.

To associate an Elastic Graphics accelerator during instance launch (AWS CLI)

You can use the `run-instances` AWS CLI command with the following parameter:

```
--elastic-gpu-specification Type=eg1.medium
```

For the `--security-group-ids` parameter, you must include a security group that has the required inbound and outbound rules. For more information, see [Configure your security groups \(p. 1138\)](#).

To associate an Elastic Graphics accelerator during instance launch (Tools for Windows PowerShell)

Use the `New-EC2Instance` Tools for Windows PowerShell command.

Install the required software for Elastic Graphics

If you launched your instance using a current AWS Windows AMI, the required software is installed automatically during the first boot. If you launched your instance using Windows AMIs that do not

automatically install the required software, you must install the required software on the instance manually.

To install the required software for Elastic Graphics (if necessary)

1. Connect to the instance.
2. Download the [Elastic Graphics installer](#) and open it. The installation manager connects to the Elastic Graphics endpoint and downloads the latest version of the required software.

Note

If the download link does not work, try a different browser, or copy the link address and paste it into a new browser tab.

3. Reboot the instance to verify.

Verify Elastic Graphics functionality on your instance

The Elastic Graphics packages on your instance include tools that you can use to view the status of the accelerator, and to verify that OpenGL commands from your instance to the accelerator are functional.

If your instance was launched with an AMI that does not have the Elastic Graphics packages pre-installed, you can download and install them yourself. For more information, see [Install the required software for Elastic Graphics \(p. 1139\)](#).

You can use one of the following methods to verify Elastic Graphics functionality on your instance.

Note

If the Elastic Graphics status monitor or command line tool returns an unexpected result, see [Resolve unhealthy status issues \(p. 1148\)](#).

Elastic Graphics status monitor

You can use the status monitor tool to view information about the status of an attached Elastic Graphics accelerator. By default, this tool is available in the notification area of the taskbar in your Windows instance and shows the status of the graphics accelerator. The following are the possible values.

Healthy

The Elastic Graphics accelerator is enabled and healthy.

Updating

The status of the Elastic Graphics accelerator is currently updating. It might take a few minutes to display the status.

Out of service

The Elastic Graphics accelerator is out of service. To get more information about the error, choose [Read More](#).

Elastic Graphics command line tool

You can use the Elastic Graphics command line tool, egcli.exe, to check the status of the accelerator. If there is a problem with the accelerator, the tool returns an error message.

To launch the tool, open a command prompt from within your instance and run the following command:

```
C:\Program Files\Amazon\EC2ElasticGPUs\manager\egcli.exe
```

The tool also supports the following parameters:

--json, -j

Indicates whether to show the JSON message. The possible values are true and false. The default is true.

--imds, -i

Indicates whether to check the instance metadata for the availability of the accelerator. The possible values are true and false. The default is true.

The following is example output. A status of OK indicates that the accelerator is enabled and healthy.

```
EG Infrastructure is available.  
Instance ID egpu-f6d94dfa66df4883b284e96db7397ee6  
Instance Type eg1.large  
EG Version 1.0.0.885 (Manager) / 1.0.0.95 (OpenGL Library) / 1.0.0.69 (OpenGL  
    Redirector)  
EG Status: Healthy  
JSON Message:  
{  
    "version": "2016-11-30",  
    "status": "OK"  
}
```

The following are the possible values for status:

OK

The Elastic Graphics accelerator is enabled and healthy.

UPDATING

The Elastic Graphics driver is being updated.

NEEDS_REBOOT

The Elastic Graphics driver has been updated and a reboot of the Amazon EC2 instance is required.

LOADING_DRIVER

The Elastic Graphics driver is being loaded.

CONNECTING_EGPU

The Elastic Graphics driver is verifying the connectivity with the Elastic Graphics accelerator.

ERROR_UPDATE_RETRY

An error occurred while updating the Elastic Graphics driver, an update will be retried soon.

ERROR_UPDATE

An unrecoverable error occurred while updating the Elastic Graphics driver.

ERROR_LOAD_DRIVER

An error occurred loading the Elastic Graphics driver.

ERROR_EGPU_CONNECTIVITY

The Elastic Graphics accelerator is unreachable.

View Elastic Graphics information

You can view information about the Elastic Graphics accelerator attached to your instance.

To view information about an Elastic Graphics accelerator (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select your instance.
3. On the **Details** tab, find **Elastic Graphics ID**. Choose the ID to view the following information about the Elastic Graphics accelerator:
 - **Attachment State**
 - **Type**
 - **Health status**

To view information about an Elastic Graphics accelerator (AWS CLI)

You can use the [describe-elastic-gpus](#) AWS CLI command:

```
aws ec2 describe-elastic-gpus
```

You can use the [describe-network-interfaces](#) AWS CLI command and filter by owner ID to view information about the Elastic Graphics network interface.

```
aws ec2 describe-network-interfaces --filters "Name=attachment.instance-owner-id,Values=amazon-elasticgpus"
```

To view information about an Elastic Graphics accelerator (Tools for Windows PowerShell)

Use the following commands:

- [Get-EC2ElasticGpu](#)
- [Get-EC2NetworkInterface](#)

To view information about an Elastic Graphics accelerator using instance metadata

1. Connect to your Windows instance that is using an Elastic Graphics accelerator.
2. Do one of the following:
 - From PowerShell, use the following cmdlet:

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/elastic-gpus/associations/egpu-f6d94dfa66df4883b284e96db7397ee6
```

- From your web browser, paste the following URL into the address field:

```
http://169.254.169.254/latest/meta-data/elastic-gpus/associations/egpu-f6d94dfa66df4883b284e96db7397ee6
```

Submit feedback

You can submit feedback about your experience with Elastic Graphics so that the team can make further improvements.

To submit feedback using the Elastic Graphics Status Monitor

1. In the notification area of the taskbar in your Windows instance, open the Elastic Graphics Status Monitor.
2. In the lower left corner, choose **Feedback**.
3. Enter your feedback and choose **Submit**.

Elastic Graphics maintenance

AWS might determine that an Elastic Graphics accelerator is in an *unhealthy* state if:

- A security or infrastructure update is needed
- A software update is needed
- There is an issue with the underlying host

When AWS determines that an Elastic Graphics accelerator is in an unhealthy state, it schedules the accelerator for retirement. AWS notifies you of the accelerator's pending retirement, and provides you with the remedial steps that you need to take.

Topics

- [How will I be notified? \(p. 1143\)](#)
- [What do I need to do? \(p. 1143\)](#)
- [What happens when an accelerator reaches its retirement date? \(p. 1144\)](#)

How will I be notified?

When AWS schedules an Elastic Graphics accelerator for retirement, it sends an accelerator retirement notice to your [AWS Health Dashboard](#). AWS also sends an email to the email address that is associated with your AWS account. This is the same email address that you use to log in to the AWS Management Console.

Note

If you use an email account that you don't check regularly, use the AWS Health Dashboard to determine if any of your Elastic Graphics accelerators are scheduled for retirement. You can also change the contact information for your AWS account on the [Account Settings](#) page.

The retirement notice provides the following:

- The ID of instance to which the accelerator is attached
- Information about the issue impacting the accelerator
- The retirement date for the accelerator
- The remedial steps that you should take

What do I need to do?

When you are notified that your Elastic Graphics accelerator is scheduled for retirement, you must [stop and start the instance \(p. 594\)](#) to which the accelerator is attached for the old, *unhealthy* accelerator to be replaced with a new, *healthy* accelerator.

We recommend that you close graphic applications running on the instance before you stop and restart the instance.

Important

If you do not stop and start your instance before the scheduled retirement date, the accelerator associated with your instance is automatically stopped, which might cause your applications to stop working.

You must stop and start the instance. Rebooting the instance will not replace the unhealthy accelerator with a healthy one.

What happens when an accelerator reaches its retirement date?

When an unhealthy Elastic Graphics accelerator reaches its scheduled retirement date, AWS permanently terminates it. To receive a replacement for your unhealthy accelerator, either before or after the retirement date, you must stop and start the instance to which the accelerator is attached.

If you do not stop and start your instance before the scheduled retirement date, the accelerator associated with your instance is automatically stopped, which might cause your applications to stop working.

Use CloudWatch metrics to monitor Elastic Graphics

You can monitor your Elastic Graphics accelerator using Amazon CloudWatch, which collects metrics about your accelerator performance. These statistics are recorded for a period of two weeks, so that you can access historical information and gain a better perspective on how your service is performing.

By default, Elastic Graphics accelerators send metric data to CloudWatch in 5-minute periods.

For more information about Amazon CloudWatch, see the [Amazon CloudWatch User Guide](#).

Elastic Graphics metrics

The AWS/ElasticGPUs namespace includes the following metrics for Elastic Graphics.

Metric	Description
GPUConnectivityCheckFailed	Reports whether connectivity to the Elastic Graphics accelerator is active or has failed. A value of zero (0) indicates that the connection is active. A value of one (1) indicates a connectivity failure. Units: Count
GPUHealthCheckFailed	Reports whether the Elastic Graphics accelerator has passed a status health check in the last minute. A value of zero (0) indicates that the status check passed. A value of one (1) indicates a status check failure. Units: Count
GPUMemoryUtilization	The GPU memory used. Units: MiB

Elastic Graphics dimensions

You can filter the metrics data for your Elastic Graphics accelerators using the following dimensions.

Dimension	Description
EGPUId	Filters the data by the Elastic Graphics accelerator.
InstanceId	Filters the data by the instance to which the Elastic Graphics accelerator is attached.

View CloudWatch metrics for Elastic Graphics

Metrics are grouped first by the service namespace, and then by the supported dimensions. You can use the following procedures to view the metrics for your Elastic Graphics accelerators.

To view Elastic Graphics metrics using the CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the Region. From the navigation bar, select the Region where your Elastic Graphics accelerator resides. For more information, see [Regions and Endpoints](#).
3. In the navigation pane, choose **Metrics**.
4. For **All metrics**, select **Elastic Graphics**, **Elastic Graphics Metrics**.

To view Elastic Graphics metrics (AWS CLI)

Use the following [list-metrics](#) command:

```
aws cloudwatch list-metrics --namespace "AWS/ElasticGPUs"
```

Create CloudWatch alarms to monitor Elastic Graphics

You can create a CloudWatch alarm that sends an Amazon SNS message when the alarm changes state. An alarm watches a single metric over a time period you specify, and sends a notification to an Amazon SNS topic based on the value of the metric relative to a given threshold over a number of time periods.

For example, you can create an alarm that monitors the health of an Elastic Graphics accelerator and sends a notification when the graphics accelerator fails a status health check for three consecutive 5-minute periods.

To create an alarm for an Elastic Graphics accelerator health status

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**, **Create Alarm**.
3. Choose **Select metric**, **Elastic Graphics**, **Elastic Graphics Metrics**.
4. Select the **GPUHealthCheckFailed** metric and choose **Select metric**.
5. Configure the alarm as follows:

- a. For **Alarm details**, type a name and description for your alarm. For **Whenever**, choose **>=** and type 1.
- b. For **Actions**, select an existing notification list or choose **New list**.
- c. Choose **Create Alarm**.

Troubleshoot

The following are common errors and troubleshooting steps.

Contents

- [Investigate application performance issues \(p. 1146\)](#)
 - [OpenGL rendering performance issues \(p. 1146\)](#)
 - [Remote access performance issues \(p. 1147\)](#)
- [Resolve unhealthy status issues \(p. 1148\)](#)
 - [Check the instance configuration \(p. 1148\)](#)
 - [Stop and start the instance \(p. 1148\)](#)
 - [Verify the installed components \(p. 1148\)](#)
 - [Check the Elastic Graphics logs \(p. 1148\)](#)
- [Why am I seeing multiple ENIs? \(p. 1148\)](#)

Investigate application performance issues

Elastic Graphics uses the instance network to send OpenGL commands to a remotely attached graphics card. In addition, a desktop running an OpenGL application with an Elastic Graphics accelerator is usually accessed using a remote access technology. It is important to distinguish between a performance problem related to the OpenGL rendering or the desktop remote access technology.

OpenGL rendering performance issues

The OpenGL rendering performance is determined by the number of OpenGL commands and frames generated on the remote instance.

Rendering performance may vary depending on the following factors:

- Elastic Graphics accelerator performance
- Network performance
- CPU performance
- Rendering model, scenario complexity
- OpenGL application behavior

An easy way to evaluate performance is to display the number of rendered frames on the remote instance. Elastic Graphics accelerators display a maximum of 25 FPS on the remote instance to achieve the best perceived quality while reducing network usage.

To show the number of frames produced

1. Open the following file in a text editor. If the file does not exist, create it.

```
C:\Program Files\Amazon\EC2ElasticGPUs\conf\eg.conf
```

2. Identify the [Application] section, or add it if it is not present, and add the following configuration parameter:

```
[Application]  
show_fps=1
```

3. Restart the application and check the FPS again.

If the FPS reaches 15-25 FPS when updating the rendered scene, then the Elastic Graphics accelerator is performing at peak. Any other performance problems you experience are likely related to the remote access to the instance desktop. If that is the case, see the Remote Access Performance Issues section.

If the FPS number is lower than 15, you can try the following:

- Improve Elastic Graphics accelerator performance by selecting a more powerful graphics accelerator type.
- Improve overall network performance by using these tips:
 - Check the amount of incoming and outgoing bandwidth to and from the Elastic Graphics accelerator endpoint. The Elastic Graphics accelerator endpoint can be retrieved with the following PowerShell command:

```
PS C:\> (Invoke-WebRequest http://169.254.169.254/latest/meta-data/elastic-gpus/  
associations/[ELASTICGPU_ID]).content
```

- The network traffic from the instance to the Elastic Graphics accelerator endpoint relates to the volume of commands the OpenGL application is producing.
- The network traffic from the Elastic Graphics accelerator endpoint to the instance relates to the number of frames generated by the graphics accelerator.
- If you see the network usage reaching the instances maximum network throughput, try using an instance with a higher network throughput allowance.
- Improve CPU performance:
 - Applications may require a lot of CPU resources in addition to what the Elastic Graphics accelerator requires. If Windows Task Manager is reporting a high usage of CPU resources, try using an instance with more CPU power.

Remote access performance issues

An instance with an attached Elastic Graphics accelerator can be accessed using different remote access technologies. Performance and quality may vary depending on:

- The remote access technology
- Instance performance
- Client performance
- Network latency and bandwidth between the client and the instance

Possible choices for the remote access protocol include:

- Microsoft Remote Desktop Connection
- NICE DCV
- VNC

For more information about optimization, see the specific protocol.

Resolve unhealthy status issues

If the Elastic Graphics accelerator is in an unhealthy state, use the following troubleshooting steps to resolve the issue.

Check the instance configuration

If the Elastic Graphics command line tool, `egcli.exe`, returns output similar to the following, ensure that your [security group is properly configured \(p. 1138\)](#) and that you launched the instance with Instance Metadata Service enabled.

```
EG Version 1.0.7.4240 (Manager) / N/A (OpenGL Library) / N/A (OpenGL Redirector)
EG Status: Out Of Service
Something prevented the EG Infrastructure to work properly.
```

Stop and start the instance

If your Elastic Graphics accelerator is in an unhealthy state, stopping the instance and starting it again is the simplest option. For more information, see [Manually stop and start an instances \(p. 596\)](#).

Warning

When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

Verify the installed components

Open the Windows Control Panel and confirm that the following components are installed:

- Amazon Elastic Graphics Manager
- Amazon Elastic Graphics OpenGL Library
- Amazon EC2 Elastic GPUs OpenGL Redirector

If any of these items are missing, you must install them manually. For more information, see [Install the required software for Elastic Graphics \(p. 1139\)](#).

Check the Elastic Graphics logs

Open the Windows Event Viewer, expand the **Application and Services Logs** section, and search for errors in the following event logs:

- EC2ElasticGPUs
- EC2ElasticGPUs GUI

Why am I seeing multiple ENIs?

When calling [StartInstances](#) on an EC2 instance with an Elastic Graphics accelerator, a new Elastic Network Interface (ENI) is created on the instance to allow OpenGL commands to be sent to the remotely attached graphics card.

If you call [StartInstances](#) many times in a short period of time (a few seconds or less) on the same EC2 instance, a new network interface is created on each call. However:

- Only one network interface will be used by the Elastic Graphics accelerator.

- Extra network interfaces don't incur any charges and will be automatically released in 24 hours.

Monitor Amazon EC2

Monitoring is an important part of maintaining the reliability, availability, and performance of your Amazon Elastic Compute Cloud (Amazon EC2) instances and your AWS solutions. You should collect monitoring data from all of the parts in your AWS solutions so that you can more easily debug a multi-point failure if one occurs. Before you start monitoring Amazon EC2, however, you should create a monitoring plan that should include:

- What are your goals for monitoring?
- What resources will you monitor?
- How often will you monitor these resources?
- What monitoring tools will you use?
- Who will perform the monitoring tasks?
- Who should be notified when something goes wrong?

After you have defined your monitoring goals and have created your monitoring plan, the next step is to establish a baseline for normal Amazon EC2 performance in your environment. You should measure Amazon EC2 performance at various times and under different load conditions. As you monitor Amazon EC2, you should store a history of monitoring data that you collect. You can compare current Amazon EC2 performance to this historical data to help you to identify normal performance patterns and performance anomalies, and devise methods to address them. For example, you can monitor CPU utilization, disk I/O, and network utilization for your EC2 instances. When performance falls outside your established baseline, you might need to reconfigure or optimize the instance to reduce CPU utilization, improve disk I/O, or reduce network traffic.

To establish a baseline you should, at a minimum, monitor the following items:

Item to monitor	Amazon EC2 metric	Monitoring agent/CloudWatch Logs
CPU utilization	CPUUtilization (p. 1185)	
Network utilization	NetworkIn (p. 1185) NetworkOut (p. 1185)	
Disk performance	DiskReadOps (p. 1185) DiskWriteOps (p. 1185)	
Disk Reads/Writes	DiskReadBytes (p. 1185) DiskWriteBytes (p. 1185)	
Memory utilization, disk swap utilization, disk space utilization, page file utilization, log collection		[Linux and Windows Server instances] Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent [Migration from previous CloudWatch Logs agent on

Item to monitor	Amazon EC2 metric	Monitoring agent/CloudWatch Logs
		Windows Server instances] Migrate Windows Server Instance Log Collection to the CloudWatch Agent

Automated and manual monitoring

AWS provides various tools that you can use to monitor Amazon EC2. You can configure some of these tools to do the monitoring for you, while some of the tools require manual intervention.

Monitoring tools

- [Automated monitoring tools \(p. 1151\)](#)
- [Manual monitoring tools \(p. 1152\)](#)

Automated monitoring tools

You can use the following automated monitoring tools to watch Amazon EC2 and report back to you when something is wrong:

- **System status checks** – monitor the AWS systems required to use your instance to ensure that they are working properly. These checks detect problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue or you can resolve it yourself (for example, by stopping and restarting or terminating and replacing an instance). Examples of problems that cause system status checks to fail include:
 - Loss of network connectivity
 - Loss of system power
 - Software issues on the physical host
 - Hardware issues on the physical host that impact network reachability

For more information, see [Status checks for your instances \(p. 1153\)](#).

- **Instance status checks** – monitor the software and network configuration of your individual instance. These checks detect problems that require your involvement to repair. When an instance status check fails, typically you will need to address the problem yourself (for example, by rebooting the instance or by making modifications in your operating system). Examples of problems that may cause instance status checks to fail include:
 - Failed system status checks
 - Misconfigured networking or startup configuration
 - Exhausted memory
 - Corrupted file system
 - Incompatible kernel

For more information, see [Status checks for your instances \(p. 1153\)](#).

- **Amazon CloudWatch alarms** – watch a single metric over a time period you specify, and perform one or more actions based on the value of the metric relative to a given threshold over a number of time periods. The action is a notification sent to an Amazon Simple Notification Service (Amazon SNS) topic or Amazon EC2 Auto Scaling policy. Alarms invoke actions for sustained state changes only. CloudWatch alarms will not invoke actions simply because they are in a particular state; the state

must have changed and been maintained for a specified number of periods. For more information, see [Monitor your instances using CloudWatch \(p. 1183\)](#).

- **Amazon EventBridge** – automate your AWS services and respond automatically to system events. Events from AWS services are delivered to EventBridge in near real time, and you can specify automated actions to take when an event matches a rule you write. For more information, see [What is Amazon EventBridge?](#).
- **Amazon CloudWatch Logs** – monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, or other sources. For more information, see the [Amazon CloudWatch Logs User Guide](#).
- **CloudWatch agent** – collect logs and system-level metrics from both hosts and guests on your EC2 instances and on-premises servers. For more information, see [Collecting Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the [Amazon CloudWatch User Guide](#).
- **AWS Management Pack for Microsoft System Center Operations Manager** – links Amazon EC2 instances and the Windows or Linux operating systems running inside them. The AWS Management Pack is an extension to Microsoft System Center Operations Manager. It uses a designated computer in your datacenter (called a watcher node) and the Amazon Web Services APIs to remotely discover and collect information about your AWS resources. For more information, see [AWS Management Pack for Microsoft System Center \(p. 2206\)](#).

Manual monitoring tools

Another important part of monitoring Amazon EC2 involves manually monitoring those items that the monitoring scripts, status checks, and CloudWatch alarms don't cover. The Amazon EC2 and CloudWatch console dashboards provide an at-a-glance view of the state of your Amazon EC2 environment.

- Amazon EC2 Dashboard shows:
 - Service Health and Scheduled Events by Region
 - Instance state
 - Status checks
 - Alarm status
 - Instance metric details (In the navigation pane choose **Instances**, select an instance, and choose the **Monitoring** tab)
 - Volume metric details (In the navigation pane choose **Volumes**, select a volume, and choose the **Monitoring** tab)
- Amazon CloudWatch Dashboard shows:
 - Current alarms and status
 - Graphs of alarms and resources
 - Service health status

In addition, you can use CloudWatch to do the following:

- Graph Amazon EC2 monitoring data to troubleshoot issues and discover trends
- Search and browse all your AWS resource metrics
- Create and edit alarms to be notified of problems
- See at-a-glance overviews of your alarms and AWS resources

Best practices for monitoring

Use the following best practices for monitoring to help you with your Amazon EC2 monitoring tasks.

- Make monitoring a priority to head off small problems before they become big ones.

- Create and implement a monitoring plan that collects monitoring data from all of the parts in your AWS solution so that you can more easily debug a multi-point failure if one occurs. Your monitoring plan should address, at a minimum, the following questions:
 - What are your goals for monitoring?
 - What resources will you monitor?
 - How often will you monitor these resources?
 - What monitoring tools will you use?
 - Who will perform the monitoring tasks?
 - Who should be notified when something goes wrong?
- Automate monitoring tasks as much as possible.
- Check the log files on your EC2 instances.

Monitor the status of your instances

You can monitor the status of your instances by viewing status checks and scheduled events for your instances.

A status check gives you the information that results from automated checks performed by Amazon EC2. These automated checks detect whether specific issues are affecting your instances. The status check information, together with the data provided by Amazon CloudWatch, gives you detailed operational visibility into each of your instances.

You can also see status of specific events that are scheduled for your instances. The status of events provides information about upcoming activities that are planned for your instances, such as rebooting or retirement. They also provide the scheduled start and end time of each event.

Contents

- [Status checks for your instances \(p. 1153\)](#)
- [State change events for your instances \(p. 1158\)](#)
- [Scheduled events for your instances \(p. 1160\)](#)

Status checks for your instances

With instance status monitoring, you can quickly determine whether Amazon EC2 has detected any problems that might prevent your instances from running applications. Amazon EC2 performs automated checks on every running EC2 instance to identify hardware and software issues. You can view the results of these status checks to identify specific and detectable problems. The event status data augments the information that Amazon EC2 already provides about the state of each instance (such as pending, running, stopping) and the utilization metrics that Amazon CloudWatch monitors (CPU utilization, network traffic, and disk activity).

Status checks are performed every minute, returning a pass or a fail status. If all checks pass, the overall status of the instance is **OK**. If one or more checks fail, the overall status is **impaired**. Status checks are built into Amazon EC2, so they cannot be disabled or deleted.

When a status check fails, the corresponding CloudWatch metric for status checks is incremented. For more information, see [Status check metrics \(p. 1193\)](#). You can use these metrics to create CloudWatch alarms that are triggered based on the result of the status checks. For example, you can create an alarm to warn you if status checks fail on a specific instance. For more information, see [Create and edit status check alarms \(p. 1157\)](#).

You can also create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying issue. For more information, see [Recover your instance \(p. 622\)](#).

Contents

- [Types of status checks \(p. 1154\)](#)
- [View status checks \(p. 1155\)](#)
- [Report instance status \(p. 1156\)](#)
- [Create and edit status check alarms \(p. 1157\)](#)

Types of status checks

We provide system status checks and instance status checks.

System status checks

System status checks monitor the AWS systems on which your instance runs. These checks detect underlying problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue, or you can resolve it yourself. For instances backed by Amazon EBS, you can stop and start the instance yourself, which in most cases results in the instance being migrated to a new host. For Linux instances backed by instance store, you can terminate and replace the instance. For Windows instances, the root volume must be an Amazon EBS volume; instance store is not supported for the root volume. Note that instance store volumes are ephemeral and all data is lost when the instance is stopped.

The following are examples of problems that can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

If a system status check fails, we increment the [StatusCheckFailed_System \(p. 1193\)](#) metric.

Bare metal instances

If you perform a restart from the operating system on a bare metal instance, the system status check might temporarily return a fail status. When the instance becomes available, the system status check should return a pass status.

Instance status checks

Instance status checks monitor the software and network configuration of your individual instance. Amazon EC2 checks the health of the instance by sending an address resolution protocol (ARP) request to the network interface (NIC). These checks detect problems that require your involvement to repair. When an instance status check fails, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes).

The following are examples of problems that can cause instance status checks to fail:

- Failed system status checks
- Incorrect networking or startup configuration

- Exhausted memory
- Corrupted file system
- During instance reboot or while a Windows instance store-backed instance is being bundled, an instance status check reports a failure until the instance becomes available again.

If an instance status check fails, we increment the [StatusCheckFailed_Instance \(p. 1193\)](#) metric.

Bare metal instances

If you perform a restart from the operating system on a bare metal instance, the instance status check might temporarily return a fail status. When the instance becomes available, the instance status check should return a pass status.

View status checks

You can view and work with status checks using the Amazon EC2 console or the AWS CLI.

View status using the console

To view status checks using the Amazon EC2 console, perform the following steps.

To view status checks (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. On the **Instances** page, the **Status check** column lists the operational status of each instance.
4. To view the status of a specific instance, select the instance, and then choose the **Status checks** tab.

Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Avail
-	i-0c0186a12aab3741d	Running	t2.large	⚠ 1/2 checks ...	No alarms +	eu-w
-	i-0138edcaf722db475	Running	m4.large	2/2 checks ...	No alarms +	eu-w
-	i-02c65b735153975ec	Running	t3.medium	2/2 checks ...	No alarms +	eu-w

Instance: i-0c0186a12aab3741d

Status checks Info
Status checks detect problems that may impair i-0c0186a12aab3741d from running your applications.

System status checks
System reachability check passed

Instance status checks
Instance reachability check failed
Check failure at 2020/12/16 17:30 GMT+2 (about 1 month)

If your instance has a failed status check, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes).

5. To review the CloudWatch metrics for status checks, select the instance, and then choose the **Monitoring** tab. Scroll until you see the graphs for the following metrics:
 - **Status check failed (any)**
 - **Status check failed (instance)**
 - **Status check failed (system)**

For more information, see [the section called "Status check metrics" \(p. 1193\)](#).

View status using the command line

You can view status checks for running instances by using the [describe-instance-status](#) (AWS CLI) command.

To view the status of all instances, use the following command.

```
aws ec2 describe-instance-status
```

To get the status of all instances with an instance status of impaired, use the following command.

```
aws ec2 describe-instance-status \
--filters Name=instance-status.status,Values=impaired
```

To get the status of a single instance, use the following command.

```
aws ec2 describe-instance-status \
--instance-ids i-1234567890abcdef0
```

Alternatively, use the following commands:

- [Get-EC2InstanceState](#) (AWS Tools for Windows PowerShell)
- [DescribeInstanceState](#) (Amazon EC2 Query API)

Report instance status

You can provide feedback if you are having problems with an instance whose status is not shown as impaired, or if you want to send AWS additional details about the problems you are experiencing with an impaired instance.

We use reported feedback to identify issues impacting multiple customers, but do not respond to individual account issues. Providing feedback does not change the status check results that you currently see for the instance.

Report status feedback using the console

To report instance status (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, choose **Actions** (the second **Actions** menu in the bottom half of the page), and then choose **Report instance status**.
4. Complete the **Report instance status** form, and then choose **Submit**.

Report status feedback using the command line

Use the [report-instance-status](#) (AWS CLI) command to send feedback about the status of an impaired instance.

```
aws ec2 report-instance-status \
--instances i-1234567890abcdef0 \
--status impaired \
```

--reason-codes **code**

Alternatively, use the following commands:

- [Send-EC2InstanceState](#) (AWS Tools for Windows PowerShell)
- [ReportInstanceState](#) (Amazon EC2 Query API)

Create and edit status check alarms

You can use the [status check metrics \(p. 1193\)](#) to create CloudWatch alarms to notify you when an instance has a failed status check.

Create a status check alarm using the console

Use the following procedure to configure an alarm that sends you a notification by email, or stops, terminates, or recovers an instance when it fails a status check.

To create a status check alarm (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, and choose **Actions, Create status check alarm**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Create an alarm**.
5. For **Alarm notification**, turn the toggle on to configure Amazon Simple Notification Service (Amazon SNS) notifications. Select an existing Amazon SNS topic or enter a name to create a new topic.

If you add an email address to the list of recipients or created a new topic, Amazon SNS sends a subscription confirmation email message to each new address. Each recipient must confirm the subscription by choosing the link contained in that message. Alert notifications are sent only to confirmed addresses.

6. For **Alarm action**, turn the toggle on to specify an action to take when the alarm is triggered. Select the action.
7. For **Alarm thresholds**, specify the metric and criteria for the alarm.

You can leave the default settings for **Group samples by (Average)** and **Type of data to sample (Status check failed:either)**, or you can change them to suit your needs.

For **Consecutive period**, set the number of periods to evaluate and, in **Period**, enter the evaluation period duration before triggering the alarm and sending an email.

8. (Optional) For **Sample metric data**, choose **Add to dashboard**.
9. Choose **Create**.

If you need to make changes to an instance status alarm, you can edit it.

To edit a status check alarm using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage CloudWatch alarms**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Edit an alarm**.
5. For **Search for alarm**, choose the alarm.
6. When you are finished making changes, choose **Update**.

Create a status check alarm using the AWS CLI

In the following example, the alarm publishes a notification to an SNS topic, `arn:aws:sns:us-west-2:111122223333:my-sns-topic`, when the instance fails either the instance check or system status check for at least two consecutive periods. The CloudWatch metric used is `StatusCheckFailed`.

To create a status check alarm using the AWS CLI

1. Select an existing SNS topic or create a new one. For more information, see [Using the AWS CLI with Amazon SNS](#) in the *AWS Command Line Interface User Guide*.
2. Use the following [list-metrics](#) command to view the available Amazon CloudWatch metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

3. Use the following [put-metric-alarm](#) command to create the alarm.

```
aws cloudwatch put-metric-alarm --alarm-name StatusCheckFailed-Alarm-for-i-1234567890abcdef0 --metric-name StatusCheckFailed --namespace AWS/EC2 --statistic Maximum --dimensions Name=InstanceId,Value=i-1234567890abcdef0 --unit Count --period 300 --evaluation-periods 2 --threshold 1 --comparison-operator GreaterThanOrEqualToThreshold --alarm-actions arn:aws:sns:us-west-2:111122223333:my-sns-topic
```

The period is the time frame, in seconds, in which Amazon CloudWatch metrics are collected. This example uses 300, which is 60 seconds multiplied by 5 minutes. The evaluation period is the number of consecutive periods for which the value of the metric must be compared to the threshold. This example uses 2. The alarm actions are the actions to perform when this alarm is triggered. This example configures the alarm to send an email using Amazon SNS.

State change events for your instances

Amazon EC2 sends an EC2 Instance State-change Notification event to Amazon EventBridge when the state of an instance changes.

The following is example data for this event. In this example, the instance entered the pending state.

```
{  
    "id": "7bf73129-1428-4cd3-a780-95db273d1602",  
    "detail-type": "EC2 Instance State-change Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-11-11T21:29:54Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:instance/i-abcd1111"  
    ],  
    "detail": {  
        "instance-id": "i-abcd1111",  
        "state": "pending"  
    }  
}
```

The possible values for state are:

- pending
- running

- stopping
- stopped
- shutting-down
- terminated

When you launch or start an instance, it enters the pending state and then the running state. When you stop an instance, it enters the stopping state and then the stopped state. When you terminate an instance, it enters the shutting-down state and then the terminated state.

Get an email notification when an instance changes state

To receive email notifications when your instance changes state, create an Amazon SNS topic and then create an EventBridge rule for the EC2 Instance State-change Notification event.

To create an SNS topic

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In the navigation pane, choose **Topics**.
3. Choose **Create topic**.
4. For **Type**, choose **Standard**.
5. For **Name**, enter a name for your topic.
6. Choose **Create topic**.
7. Choose **Create subscription**.
8. For **Protocol**, choose **Email**.
9. For **Endpoint**, enter the email address that receives the notifications.
10. Choose **Create subscription**.
11. You'll receive an email message with the following subject line: AWS Notification - Subscription Confirmation. Follow the directions to confirm your subscription.

To create an EventBridge rule

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. For **Name**, enter a name for your rule.
4. For **Rule type**, choose **Rule with an event pattern**.
5. Choose **Next**.
6. For **Event pattern**, do the following:
 - a. For **Event source**, choose **AWS services**.
 - b. For **AWS service**, choose **EC2**.
 - c. For **Event type**, choose **EC2 Instance State-change Notification**.
 - d. By default, we send notifications for any state change for any instance. If you prefer, you can select specific states or specific instances.
7. Choose **Next**.
8. Specify a target as follows:
 - a. For **Target types**, choose **AWS service**.
 - b. For **Select a target**, choose **SNS topic**.
 - c. For **Topic**, choose the SNS topic that you created in the previous procedure.
9. Choose **Next**.

10. (Optional) Add tags to your rule.
11. Choose **Next**.
12. Choose **Create rule**.
13. To test your rule, initiate a state change. For example, start a stopped instance, stop a running instance, or launch an instance. You'll receive email messages with the following subject line: AWS Notification Message. The body of the email contains the event data.

Scheduled events for your instances

AWS can schedule events for your instances, such as a reboot, stop/start, or retirement. These events do not occur frequently. If one of your instances will be affected by a scheduled event, AWS sends an email to the email address that's associated with your AWS account prior to the scheduled event. The email provides details about the event, including the start and end date. Depending on the event, you might be able to take action to control the timing of the event. AWS also sends an AWS Health event, which you can monitor and manage by using Amazon CloudWatch Events. For more information about monitoring AWS Health events with CloudWatch, see [Monitoring AWS Health events with CloudWatch Events](#).

Scheduled events are managed by AWS; you cannot schedule events for your instances. You can view the events scheduled by AWS, customize scheduled event notifications to include or remove tags from the email notification, and perform actions when an instance is scheduled to reboot, retire, or stop.

To update the contact information for your account so that you can be sure to be notified about scheduled events, go to the [Account Settings](#) page.

Note

When an instance is affected by a scheduled event, and it is part of an Auto Scaling group, Amazon EC2 Auto Scaling eventually replaces it as part of its health checks, with no further action necessary on your part. For more information about the health checks performed by Amazon EC2 Auto Scaling, see [Health checks for Auto Scaling instances](#) in the *Amazon EC2 Auto Scaling User Guide*.

Contents

- [Types of scheduled events \(p. 1160\)](#)
- [View scheduled events \(p. 1161\)](#)
- [Customize scheduled event notifications \(p. 1164\)](#)
- [Work with instances scheduled to stop or retire \(p. 1167\)](#)
- [Work with instances scheduled for reboot \(p. 1167\)](#)
- [Work with instances scheduled for maintenance \(p. 1169\)](#)
- [Reschedule a scheduled event \(p. 1169\)](#)
- [Define event windows for scheduled events \(p. 1171\)](#)

Types of scheduled events

Amazon EC2 can create the following types of events for your instances, where the event occurs at a scheduled time:

- **Instance stop:** At the scheduled time, the instance is stopped. When you start it again, it's migrated to a new host. Applies only to instances backed by Amazon EBS.
- **Instance retirement:** At the scheduled time, the instance is stopped if it is backed by Amazon EBS, or terminated if it is backed by instance store.
- **Instance reboot:** At the scheduled time, the instance is rebooted.
- **System reboot:** At the scheduled time, the host for the instance is rebooted.

- **System maintenance:** At the scheduled time, the instance might be temporarily affected by network maintenance or power maintenance.

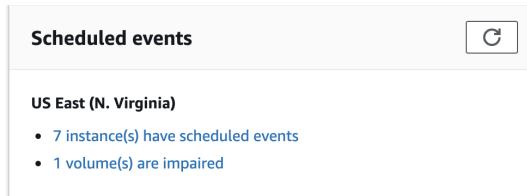

View scheduled events

In addition to receiving notification of scheduled events in email, you can check for scheduled events by using one of the following methods.

New console

To view scheduled events for your instances using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. The dashboard displays any resources with an associated event under **Scheduled events**.

3. For more detail, choose **Events** in the navigation pane. Any resources with an associated event are displayed. You can filter by characteristics such as event type, resource type, and Availability Zone.

Events (103)						
Resource type: instance		Event status: Scheduled		Event type: instance-stop		
Resource ID	Event status	Event type	Description	Progress	Duration	Start time
i-02c48fffb61cd16f	Scheduled	Instance-stop	The Instance is running on ...	Starts in 13 days		2019/07/22 13:00 GMT+2

Old console

To view scheduled events for your instances using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. You can view scheduled events in the following screens:
 - In the navigation pane, choose **Events**. Any resources with an associated event are displayed. You can filter by resource type, or by specific event types. You can select the resource to view details.

Filter: All resource types ▾ All event types ▾ Ongoing and scheduled ▾			
Resource Name ▾	Resource Type ▾	Resource Id ▾	Event Type ▾
my-instance	instance	i-c3870335	instance-stop

Event: i-c3870335

Availability Zone us-west-2a
Event type instance-stop
Event status Scheduled
Description The instance is running on degraded hardware
Start time May 22, 2015 at 5:00:00 PM UTC-7
End time

- Alternatively, in the navigation pane, choose **EC2 Dashboard**. Any resources with an associated event are displayed under **Scheduled Events**.

Scheduled Events

US West (Oregon):

1 instances have scheduled events

- Some events are also shown for affected resources. For example, in the navigation pane, choose **Instances** and select an instance. If the instance has an associated instance stop or instance retirement event, it is displayed in the lower pane.

Retiring: This instance is scheduled for retirement after May 22, 2015 at 5:00:00 PM UTC-7. ⓘ

AWS CLI

To view scheduled events for your instances using the AWS CLI

Use the [describe-instance-status](#) command.

```
aws ec2 describe-instance-status \
--instance-id i-1234567890abcdef0 \
--query "InstanceStatuses[].[Events]"
```

The following example output shows a reboot event.

```
[{"Events": [
  {
    "InstanceEventId": "instance-event-0d59937288b749b32",
    "Code": "system-reboot",
    "Description": "The instance is scheduled for a reboot",
    "NotAfter": "2019-03-15T22:00:00.000Z",
    "NotBefore": "2019-03-14T20:00:00.000Z",
    "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"
  }
]}
```

```
]
```

The following example output shows an instance retirement event.

```
[  
    "Events": [  
        {  
            "InstanceEventId": "instance-event-0e439355b779n26",  
            "Code": "instance-stop",  
            "Description": "The instance is running on degraded hardware",  
            "NotBefore": "2015-05-23T00:00:00.000Z"  
        }  
    ]  
]
```

PowerShell

To view scheduled events for your instances using the AWS Tools for Windows PowerShell

Use the following [Get-EC2InstanceState](#) command.

```
PS C:\> (Get-EC2InstanceState -InstanceId i-1234567890abcdef0).Events
```

The following example output shows an instance retirement event.

```
Code      : instance-stop  
Description : The instance is running on degraded hardware  
NotBefore : 5/23/2015 12:00:00 AM
```

Instance metadata

To view scheduled events for your instances using instance metadata

You can retrieve information about active maintenance events for your instances from the [instance metadata \(p. 862\)](#) by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \  
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/events/maintenance/scheduled
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/events/maintenance/scheduled
```

The following is example output with information about a scheduled system reboot event, in JSON format.

```
[  
    {  
        "NotBefore" : "21 Jan 2019 09:00:43 GMT",  
        "Code" : "system-reboot",  
        "Description" : "scheduled reboot",  
        "EventId" : "instance-event-0d59937288b749b32",  
        "NotAfter" : "21 Jan 2019 09:17:23 GMT",  
    }  
]
```

```
        "State" : "active"  
    }  
]
```

To view event history about completed or canceled events for your instances using instance metadata

You can retrieve information about completed or canceled events for your instances from [instance metadata \(p. 862\)](#) by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \  
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/events/maintenance/history
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/events/maintenance/history
```

The following is example output with information about a system reboot event that was canceled, and a system reboot event that was completed, in JSON format.

```
[  
  {  
    "NotBefore" : "21 Jan 2019 09:00:43 GMT",  
    "Code" : "system-reboot",  
    "Description" : "[Canceled] scheduled reboot",  
    "EventId" : "instance-event-0d59937288b749b32",  
    "NotAfter" : "21 Jan 2019 09:17:23 GMT",  
    "State" : "canceled"  
  },  
  {  
    "NotBefore" : "29 Jan 2019 09:00:43 GMT",  
    "Code" : "system-reboot",  
    "Description" : "[Completed] scheduled reboot",  
    "EventId" : "instance-event-0d59937288b749b32",  
    "NotAfter" : "29 Jan 2019 09:17:23 GMT",  
    "State" : "completed"  
  }  
]
```

AWS Health

You can use the AWS Health Dashboard to learn about events that can affect your instance. The AWS Health Dashboard organizes issues in three groups: open issues, scheduled changes, and other notifications. The scheduled changes group contains items that are ongoing or upcoming.

For more information, see [Getting started with the AWS Health Dashboard](#) in the *AWS Health User Guide*.

Customize scheduled event notifications

You can customize scheduled event notifications to include tags in the email notification. This makes it easier to identify the affected resource (instances or Dedicated Hosts) and to prioritize actions for the upcoming event.

When you customize event notifications to include tags, you can choose to include:

- All of the tags that are associated with the affected resource
- Only specific tags that are associated with the affected resource

For example, suppose that you assign application, costcenter, project, and owner tags to all of your instances. You can choose to include all of the tags in event notifications. Alternatively, if you'd like to see only the owner and project tags in event notifications, then you can choose to include only those tags.

After you select the tags to include, the event notifications will include the resource ID (instance ID or Dedicated Host ID) and the tag key and value pairs that are associated with the affected resource.

Tasks

- [Include tags in event notifications \(p. 1165\)](#)
- [Remove tags from event notifications \(p. 1166\)](#)
- [View the tags to be included in event notifications \(p. 1166\)](#)

Include tags in event notifications

The tags that you choose to include apply to all resources (instances and Dedicated Hosts) in the selected Region. To customize event notifications in other Regions, first select the required Region and then perform the following steps.

You can include tags in event notifications by using one of the following methods.

New console

To include tags in event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.
4. Turn on **Include tags in event notifications**.
5. Do one of the following, depending on the tags that you want to include in event notifications:
 - To include all tags associated with the affected instance or Dedicated Host, select **Include all tags**.
 - To select the tags to include, select **Choose the tags to include** and then select or enter the tag keys.
6. Choose **Save**.

AWS CLI

To include all tags in event notifications

Use the [register-instance-event-notification-attributes](#) AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `true`.

```
aws ec2 register-instance-event-notification-attributes --instance-tag-attribute "IncludeAllTagsOfInstance=true"
```

To include specific tags in event notifications

Use the [register-instance-event-notification-attributes](#) AWS CLI command and specify the tags to include by using the `InstanceTagKeys` parameter.

```
aws ec2 register-instance-event-notification-attributes --instance-tag-attribute  
'InstanceTagKeys=["tag_key_1", "tag_key_2", "tag_key_3"]'
```

Remove tags from event notifications

You can remove tags from event notifications by using one of the following methods.

New console

To remove tags from event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.
4. To remove all tags from event notifications, turn off **Include tags in event notifications**.
5. To remove specific tags from event notifications, choose the X) for the corresponding tag keys.
6. Choose **Save**.

AWS CLI

To remove all tags from event notifications

Use the [deregister-instance-event-notification-attributes](#) AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `false`.

```
aws ec2 deregister-instance-event-notification-attributes --instance-tag-attribute  
"IncludeAllTagsOfInstance=false"
```

To remove specific tags from event notifications

Use the [deregister-instance-event-notification-attributes](#) AWS CLI command and specify the tags to remove by using the `InstanceTagKeys` parameter.

```
aws ec2 deregister-instance-event-notification-attributes --instance-tag-attribute  
'InstanceTagKeys=["tag_key_1", "tag_key_2", "tag_key_3"]'
```

View the tags to be included in event notifications

You can view the tags that are to be included in event notifications by using one of the following methods.

New console

To view the tags that are to be included in event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.

AWS CLI

To view the tags that are to be included in event notifications

Use the [describe-instance-event-notification-attributes](#) AWS CLI command.

```
aws ec2 describe-instance-event-notification-attributes
```

Work with instances scheduled to stop or retire

When AWS detects irreparable failure of the underlying host for your instance, it schedules the instance to stop or terminate, depending on the type of root device for the instance. If the root device is an EBS volume, the instance is scheduled to stop. If the root device is an instance store volume, the instance is scheduled to terminate. For more information, see [Instance retirement \(p. 613\)](#).

Important

Any data stored on instance store volumes is lost when an instance is stopped, hibernated, or terminated. This includes instance store volumes that are attached to an instance that has an EBS volume as the root device. Be sure to save data from your instance store volumes that you might need later before the instance is stopped, hibernated, or terminated.

Actions for Instances Backed by Amazon EBS

You can wait for the instance to stop as scheduled. Alternatively, you can stop and start the instance yourself, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see [Stop and start your instance \(p. 594\)](#).

You can automate an immediate stop and start in response to a scheduled instance stop event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*.

Actions for Instances Backed by Instance Store

We recommend that you launch a replacement instance from your most recent AMI and migrate all necessary data to the replacement instance before the instance is scheduled to terminate. Then, you can terminate the original instance, or wait for it to terminate as scheduled.

Work with instances scheduled for reboot

When AWS must perform tasks such as installing updates or maintaining the underlying host, it can schedule the instance or the underlying host for a reboot. You can [reschedule most reboot events \(p. 1169\)](#) so that your instance is rebooted at a specific date and time that suits you.

View the reboot event type

You can view whether a reboot event is an instance reboot or a system reboot by using one of the following methods.

New console

To view the type of scheduled reboot event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. For each instance, view the value in the **Event type** column. The value is either **system-reboot** or **instance-reboot**.

Old console

To view the type of scheduled reboot event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Events**.
3. Choose **Instance resources** from the filter list.
4. For each instance, view the value in the **Event Type** column. The value is either **system-reboot** or **instance-reboot**.

AWS CLI

To view the type of scheduled reboot event using the AWS CLI

Use the [describe-instance-status](#) command.

```
aws ec2 describe-instance-status --instance-id i-1234567890abcdef0
```

For scheduled reboot events, the value for Code is either **system-reboot** or **instance-reboot**. The following example output shows a **system-reboot** event.

```
[  
  "Events": [  
    {  
      "InstanceEventId": "instance-event-0d59937288b749b32",  
      "Code": "system-reboot",  
      "Description": "The instance is scheduled for a reboot",  
      "NotAfter": "2019-03-14T22:00:00.000Z",  
      "NotBefore": "2019-03-14T20:00:00.000Z",  
      "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"  
    }  
  ]  
]
```

Actions for instance reboot

You can wait for the instance reboot to occur within its scheduled maintenance window, [reschedule \(p. 1169\)](#) the instance reboot to a date and time that suits you, or [reboot \(p. 612\)](#) the instance yourself at a time that is convenient for you.

After your instance is rebooted, the scheduled event is cleared and the event's description is updated. The pending maintenance to the underlying host is completed, and you can begin using your instance again after it has fully booted.

Actions for system reboot

It is not possible for you to reboot the system yourself. You can wait for the system reboot to occur during its scheduled maintenance window, or you can [reschedule \(p. 1169\)](#) the system reboot to a date and time that suits you. A system reboot typically completes in a matter of minutes. After the system reboot has occurred, the instance retains its IP address and DNS name, and any data on local instance store volumes is preserved. After the system reboot is complete, the scheduled event for the instance is cleared, and you can verify that the software on your instance is operating as expected.

Alternatively, if it is necessary to maintain the instance at a different time and you can't reschedule the system reboot, then you can stop and start an Amazon EBS-backed instance, which migrates it to a new host. However, the data on the local instance store volumes is not preserved. You can also automate an immediate instance stop and start in response to a scheduled system reboot event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*. For an instance store-backed instance, if you can't reschedule the system reboot, then you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

Work with instances scheduled for maintenance

When AWS must maintain the underlying host for an instance, it schedules the instance for maintenance. There are two types of maintenance events: network maintenance and power maintenance.

During network maintenance, scheduled instances lose network connectivity for a brief period of time. Normal network connectivity to your instance is restored after maintenance is complete.

During power maintenance, scheduled instances are taken offline for a brief period, and then rebooted. When a reboot is performed, all of your instance's configuration settings are retained.

After your instance has rebooted (this normally takes a few minutes), verify that your application is working as expected. At this point, your instance should no longer have a scheduled event associated with it, or if it does, the description of the scheduled event begins with **[Completed]**. It sometimes takes up to 1 hour for the instance status description to refresh. Completed maintenance events are displayed on the Amazon EC2 console dashboard for up to a week.

Actions for Instances Backed by Amazon EBS

You can wait for the maintenance to occur as scheduled. Alternatively, you can stop and start the instance, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see [Stop and start your instance \(p. 594\)](#).

You can automate an immediate stop and start in response to a scheduled maintenance event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*.

Actions for instances backed by instance store

You can wait for the maintenance to occur as scheduled. Alternatively, if you want to maintain normal operation during a scheduled maintenance window, you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

Reschedule a scheduled event

You can reschedule an event so that it occurs at a specific date and time that suits you. Only events that have a deadline date can be rescheduled. There are other [limitations for rescheduling an event \(p. 1171\)](#).

You can reschedule an event by using one of the following methods.

New console

To reschedule an event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. Select one or more instances, and then choose **Actions, Schedule event**.

Only events that have an event deadline date, indicated by a value for **Deadline**, can be rescheduled. If one of the selected events does not have a deadline date, **Actions, Schedule event** is disabled.

5. For **New start time**, enter a new date and time for the event. The new date and time must occur before the **Event deadline**.
6. Choose **Save**.

It might take a minute or 2 for the updated event start time to be reflected in the console.

Old console

To reschedule an event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Instance resources** from the filter list.
4. Select one or more instances, and then choose **Actions, Schedule Event**.

Only events that have an event deadline date, indicated by a value for **Event Deadline**, can be rescheduled.

5. For **Event start time**, enter a new date and time for the event. The new date and time must occur before the **Event Deadline**.
6. Choose **Schedule Event**.

It might take a minute or 2 for the updated event start time to be reflected in the console.

AWS CLI

To reschedule an event using the AWS CLI

1. Only events that have an event deadline date, indicated by a value for `NotBeforeDeadline`, can be rescheduled. Use the [describe-instance-status](#) command to view the `NotBeforeDeadline` parameter value.

```
aws ec2 describe-instance-status --instance-id i-1234567890abcdef0
```

The following example output shows a system-reboot event that can be rescheduled because `NotBeforeDeadline` contains a value.

```
[  
  "Events": [  
    {  
      "InstanceEventId": "instance-event-0d59937288b749b32",  
      "Code": "system-reboot",  
      "Description": "The instance is scheduled for a reboot",  
      "NotAfter": "2019-03-14T22:00:00.000Z",  
      "NotBefore": "2019-03-14T20:00:00.000Z",  
      "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"  
    }  
  ]
```

2. To reschedule the event, use the [modify-instance-event-start-time](#) command. Specify the new event start time by using the `not-before` parameter. The new event start time must fall before the `NotBeforeDeadline`.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0  
  --instance-event-id instance-event-0d59937288b749b32 --not-  
  before 2019-03-25T10:00:00.000
```

It might take a minute or 2 before the [describe-instance-status](#) command returns the updated `not-before` parameter value.

Limitations

- Only events with an event deadline date can be rescheduled. The event can be rescheduled up to the event deadline date. The **Deadline** column in the console and the `NotBeforeDeadline` field in the AWS CLI indicate if the event has a deadline date.
- Only events that have not yet started can be rescheduled. The **Start time** column in the console and the `NotBefore` field in the AWS CLI indicate the event start time. Events that are scheduled to start in the next 5 minutes cannot be rescheduled.
- The new event start time must be at least 60 minutes from the current time.
- If you reschedule multiple events using the console, the event deadline date is determined by the event with the earliest event deadline date.

Define event windows for scheduled events

You can define custom event windows that recur weekly for scheduled events that reboot, stop, or terminate your Amazon EC2 instances. You can associate one or more instances with an event window. If a scheduled event for those instances is planned, AWS will schedule the events within the associated event window.

You can use event windows to maximize workload availability by specifying event windows that occur during off-peak periods for your workload. You can also align the event windows with your internal maintenance schedules.

You define an event window by specifying a set of time ranges. The minimum time range is 2 hours. The combined time ranges must total at least 4 hours.

You can associate one or more instances with an event window by using either instance IDs or instance tags. You can also associate Dedicated Hosts with an event window by using the host ID.

Warning

Event windows are applicable only for scheduled events that stop, reboot, or terminate instances.

Event windows are *not* applicable for:

- Expedited scheduled events and network maintenance events.
- Unscheduled maintenance such as AutoRecovery and unplanned reboots.

Work with event windows

- [Considerations \(p. 1171\)](#)
- [View event windows \(p. 1172\)](#)
- [Create event windows \(p. 1174\)](#)
- [Modify event windows \(p. 1177\)](#)
- [Delete event windows \(p. 1181\)](#)
- [Tag event windows \(p. 1182\)](#)

Considerations

- All event window times are in UTC.
- The minimum weekly event window duration is 4 hours.
- The time ranges within an event window must each be at least 2 hours.
- Only one target type (instance ID, Dedicated Host ID, or instance tag) can be associated with an event window.

- A target (instance ID, Dedicated Host ID, or instance tag) can only be associated with one event window.
- A maximum of 100 instance IDs, or 50 Dedicated Host IDs, or 50 instance tags can be associated with an event window. The instance tags can be associated with any number of instances.
- A maximum of 200 event windows can be created per AWS Region.
- Multiple instances that are associated with event windows can potentially have scheduled events occur at the same time.
- If AWS has already scheduled an event, modifying an event window won't change the time of the scheduled event. If the event has a deadline date, you can [reschedule the event \(p. 1169\)](#).
- You can stop and start an instance prior to the scheduled event, which migrates the instance to a new host, and the scheduled event will no longer take place.

View event windows

You can view event windows by using one of the following methods.

Console

To view event windows using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select an event window to view its details.

AWS CLI

To describe all event windows using the AWS CLI

Use the [describe-instance-event-windows](#) command.

```
aws ec2 describe-instance-event-windows \
--region us-east-1
```

Expected output

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-0598c7d356eba48d7"
                ],
                "Tags": [],
                "DedicatedHostIds": []
            },
            "State": "active",
            "Tags": []
        }
        ...
    ],
}
```

```
    "NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"  
}
```

To describe a specific event window using the AWS CLI

Use the [describe-instance-event-windows](#) command with the `--instance-event-window-id` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \  
  --region us-east-1 \  
  --instance-event-window-id iew-0abcdef1234567890
```

To describe event windows that match one or more filters using the AWS CLI

Use the [describe-instance-event-windows](#) command with the `--filters` parameter. In the following example, the `instance-id` filter is used to describe all of the event windows that are associated with the specified instance.

When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the instance's tags or Dedicated Host ID (if the instance is on a Dedicated Host).

For the list of supported filters, see [describe-instance-event-windows](#) in the *AWS CLI Reference*.

```
aws ec2 describe-instance-event-windows \  
  --region us-east-1 \  
  --filters Name=instance-id,Values=i-1234567890abcdef0 \  
  --max-results 100 \  
  --next-token <next-token-value>
```

Expected output

In the following example, the instance is on a Dedicated Host, which is associated with the event window.

```
{  
  "InstanceEventWindows": [  
    {  
      "InstanceEventWindowId": "iew-0dbc0adb66f235982",  
      "TimeRanges": [  
        {  
          "StartWeekDay": "sunday",  
          "StartHour": 2,  
          "EndWeekDay": "sunday",  
          "EndHour": 8  
        }  
      ],  
      "Name": "myEventWindowName",  
      "AssociationTarget": {  
        "InstanceIds": [],  
        "Tags": [],  
        "DedicatedHostIds": [  
          "h-0140d9a7ecbd102dd"  
        ]  
      },  
      "State": "active",  
      "Tags": []  
    }  
  ]  
}
```

Create event windows

You can create one or more event windows. For each event window, you specify one or more blocks of time. For example, you can create an event window with blocks of time that occur every day at 4 AM for 2 hours. Or you can create an event window with blocks of time that occur on Sundays from 2 AM to 4 AM and on Wednesdays from 3 AM to 5 AM.

For the event window constraints, see [Considerations \(p. 1171\)](#) earlier in this topic.

Event windows recur weekly until you delete them.

Use one of the following methods to create an event window.

Console

To create an event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Create instance event window**.
4. For **Event window name**, enter a descriptive name for the event window.
5. For **Event window schedule**, choose to specify the blocks of time in the event window by using the cron schedule builder or by specifying time ranges.
 - If you choose **Cron schedule builder**, specify the following:
 1. For **Days (UTC)**, specify the days of the week on which the event window occurs.
 2. For **Start time (UTC)**, specify the time when the event window begins.
 3. For **Duration**, specify the duration of the blocks of time in the event window. The minimum duration per block of time is 2 hours. The minimum duration of the event window must equal or exceed 4 hours in total. All times are in UTC.
 - If you choose **Time ranges**, choose **Add new time range** and specify the start day and time and the end day and time. Repeat for each time range. The minimum duration per time range is 2 hours. The minimum duration for all time ranges combined must equal or exceed 4 hours in total.
6. (Optional) For **Target details**, associate one or more instances with the event window so that if the instances are scheduled for maintenance, the scheduled event will occur during the associated event window. You can associate one or more instances with an event window by using instance IDs or instance tags. You can associate Dedicated Hosts with an event window by using the host ID.

Note that you can create the event window without associating a target with the window. Later, you can modify the window to associate one or more targets.
7. (Optional) For **Event window tags**, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.
8. Choose **Create event window**.

AWS CLI

To create an event window using the AWS CLI, you first create the event window, and then you associate one or more targets with the event window.

Create an event window

You can define either a set of time ranges or a cron expression when creating the event window, but not both.

To create an event window with a time range using the AWS CLI

Use the [create-instance-event-window](#) command and specify the `--time-range` parameter. You can't also specify the `--cron-expression` parameter.

```
aws ec2 create-instance-event-window \
--region us-east-1 \
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
--tag-specifications "ResourceType=instance-event-window,Tags=[{Key=K1,Value=V1}]" \
--name myEventWindowName
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

To create an event window with a cron expression using the AWS CLI

Use the [create-instance-event-window](#) command and specify the `--cron-expression` parameter. You can't also specify the `--time-range` parameter.

```
aws ec2 create-instance-event-window \
--region us-east-1 \
--cron-expression "* 21-23 * * 2,3" \
--tag-specifications "ResourceType=instance-event-window,Tags=[{Key=K1,Value=V1}]" \
--name myEventWindowName
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

}

Associate a target with an event window

You can associate only one type of target (instance IDs, Dedicated Host IDs, or instance tags) with an event window.

To associate instance tags with an event window using the AWS CLI

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [  
                {  
                    "Key": "k2",  
                    "Value": "v2"  
                },  
                {  
                    "Key": "k1",  
                    "Value": "v1"  
                }  
            ],  
            "DedicatedHostIds": []  
        },  
        "State": "creating"  
    }  
}
```

To associate one or more instances with an event window using the AWS CLI

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": ["i-1234567890abcdef0", "i-0598c7d356eba48d7"]  
        },  
        "State": "creating"  
    }  
}
```

```
"AssociationTarget": {  
    "InstanceIds": [  
        "i-1234567890abcdef0",  
        "i-0598c7d356eba48d7"  
    ],  
    "Tags": [],  
    "DedicatedHostIds": []  
},  
    "State": "creating"  
}  
}
```

To associate a Dedicated Host with an event window using the AWS CLI

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \  
    --region us-east-1 \  
    --instance-event-window-id iew-0abcdef1234567890 \  
    --association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [],  
            "DedicatedHostIds": [  
                "h-029fa35a02b99801d"  
            ]  
        },  
        "State": "creating"  
    }  
}
```

Modify event windows

You can modify all of the fields of an event window except its ID. For example, when daylight savings begin, you might want to modify the event window schedule. For existing event windows, you might want to add or remove targets.

Use one of the following methods to modify an event window.

Console

To modify an event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to modify, and then choose **Actions, Modify instance event window**.
5. Modify the fields in the event window, and then choose **Modify event window**.

AWS CLI

To modify an event window using the AWS CLI, you can modify the time range or cron expression, and associate or disassociate one or more targets with the event window.

Modify the event window time

You can modify either a time range or a cron expression when modifying the event window, but not both.

To modify the time range of an event window using the AWS CLI

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--time-range` parameter to modify the time range. You can't also specify the `--cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

To modify a set of time ranges for an event window using the AWS CLI

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--time-range` parameter to modify the time range. You can't also specify the `--cron-expression` parameter in the same call.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
```

```
--time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8}, {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday", "EndHour": 8}]'
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "TimeRanges": [  
            {  
                "StartWeekDay": "monday",  
                "StartHour": 2,  
                "EndWeekDay": "wednesday",  
                "EndHour": 8  
            },  
            {  
                "StartWeekDay": "thursday",  
                "StartHour": 2,  
                "EndWeekDay": "friday",  
                "EndHour": 8  
            }  
        ],  
        "Name": "myEventWindowName",  
        "AssociationTarget": {  
            "InstanceIds": [  
                "i-0abcdef1234567890",  
                "i-0be35f9acb8ba01f0"  
            ],  
            "Tags": [],  
            "DedicatedHostIds": []  
        },  
        "State": "creating",  
        "Tags": [  
            {  
                "Key": "K1",  
                "Value": "V1"  
            }  
        ]  
    }  
}
```

To modify the cron expression of an event window using the AWS CLI

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--cron-expression` parameter to modify the cron expression. You can't also specify the `--time-range` parameter.

```
aws ec2 modify-instance-event-window \  
    --region us-east-1 \  
    --instance-event-window-id iew-0abcdef1234567890 \  
    --cron-expression "* 21-23 * * 2,3"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [
```

```
        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
    ],
    "Tags": [],
    "DedicatedHostIds": []
},
"State": "creating",
"Tags": [
    {
        "Key": "K1",
        "Value": "V1"
    }
]
}
```

Modify the targets associated with an event window

You can associate additional targets with an event window. You can also disassociate existing targets from an event window. However, only one type of target (instance IDs, Dedicated Host IDs, or instance tags) can be associated with an event window.

To associate additional targets with an event window

For the instructions on how to associate targets with an event window, see [Associate a target with an event window](#).

To disassociate instance tags from an event window using the AWS CLI

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

To disassociate one or more instances from an event window using the AWS CLI

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 disassociate-instance-event-window \
```

```
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

To disassociate a Dedicated Host from an event window using the AWS CLI

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target DedicatedHostIds=h-029fa35a02b99801d
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

Delete event windows

You can delete one event window at a time by using one of the following methods.

Console

To delete an event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.

4. Select the event window to delete, and then choose **Actions, Delete instance event window**.
5. When prompted, enter **delete**, and then choose **Delete**.

AWS CLI

To delete an event window using the AWS CLI

Use the [delete-instance-event-window](#) command and specify the event window to delete.

```
aws ec2 delete-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890
```

To force delete an event window using the AWS CLI

Use the **--force-delete** parameter if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--force-delete
```

Expected output

```
{
  "InstanceEventWindowState": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "State": "deleting"
  }
}
```

Tag event windows

You can tag an event window when you create it, or afterwards.

To tag an event window when you create it, see [Create event windows \(p. 1174\)](#).

Use one of the following methods to tag an event window.

Console

To tag an existing event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to tag, and then choose **Actions, Manage instance event window tags**.
5. Choose **Add tag** to add a tag. Repeat for each tag.
6. Choose **Save**.

AWS CLI

To tag an existing event window using the AWS CLI

Use the [create-tags](#) command to tag existing resources. In the following example, the existing event window is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
--resources i-ew-0abcdef1234567890 \
--tags Key=purpose,Value=test
```

Monitor your instances using CloudWatch

You can monitor your instances using Amazon CloudWatch, which collects and processes raw data from Amazon EC2 into readable, near real-time metrics. These statistics are recorded for a period of 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing.

By default, Amazon EC2 sends metric data to CloudWatch in 5-minute periods. To send metric data for your instance to CloudWatch in 1-minute periods, you can enable detailed monitoring on the instance. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 1183\)](#).

The Amazon EC2 console displays a series of graphs based on the raw data from Amazon CloudWatch. Depending on your needs, you might prefer to get data for your instances from Amazon CloudWatch instead of the graphs in the console.

For more information about Amazon CloudWatch, see the [Amazon CloudWatch User Guide](#).

Contents

- [Enable or turn off detailed monitoring for your instances \(p. 1183\)](#)
- [List the available CloudWatch metrics for your instances \(p. 1185\)](#)
- [Get statistics for metrics for your instances \(p. 1198\)](#)
- [Graph metrics for your instances \(p. 1206\)](#)
- [Create a CloudWatch alarm for an instance \(p. 1206\)](#)
- [Create alarms that stop, terminate, reboot, or recover an instance \(p. 1207\)](#)

Enable or turn off detailed monitoring for your instances

By default, your instance is enabled for basic monitoring. You can optionally enable detailed monitoring. After you enable detailed monitoring, the Amazon EC2 console displays monitoring graphs with a 1-minute period for the instance.

The following describes the data interval and charge for basic and detailed monitoring for instances.

Monitoring type	Description	Charges
Basic monitoring	Data is available automatically in 5-minute periods.	No charge.
Detailed monitoring	Data is available in 1-minute periods. To get this level of data, you must specifically enable it for the instance. For the instances where you've enabled detailed monitoring, you can also get aggregated data across groups of similar instances.	You are charged per metric that is sent to CloudWatch. You are not charged for data storage. For more information, see Paid tier and Example 1 - EC2 Detailed Monitoring on the Amazon CloudWatch pricing page .

Topics

- [Required IAM permissions \(p. 1184\)](#)
- [Enable detailed monitoring \(p. 1184\)](#)
- [Turn off detailed monitoring \(p. 1184\)](#)

Required IAM permissions

To enable detailed monitoring for an instance, your user must have permission to use the [MonitorInstances](#) API action. To turn off detailed monitoring for an instance, your user must have permission to use the [UnmonitorInstances](#) API action.

Enable detailed monitoring

You can enable detailed monitoring on an instance as you launch it or after the instance is running or stopped. Enabling detailed monitoring on an instance does not affect the monitoring of the EBS volumes attached to the instance. For more information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1979\)](#).

Console

To enable detailed monitoring for an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, select the **Enable** check box.
5. Choose **Save**.

To enable detailed monitoring when launching an instance

When launching an instance using the AWS Management Console, select the **Monitoring** check box on the **Configure Instance Details** page.

AWS CLI

To enable detailed monitoring for an existing instance

Use the following [monitor-instances](#) command to enable detailed monitoring for the specified instances.

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

To enable detailed monitoring when launching an instance

Use the [run-instances](#) command with the **--monitoring** flag to enable detailed monitoring.

```
aws ec2 run-instances --image-id ami-09092360 --monitoring Enabled=true...
```

Turn off detailed monitoring

You can turn off detailed monitoring on an instance as you launch it or after the instance is running or stopped.

Console

To turn off detailed monitoring

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, clear the **Enable** check box.
5. Choose **Save**.

AWS CLI

To turn off detailed monitoring

Use the following [unmonitor-instances](#) command to turn off detailed monitoring for the specified instances.

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

List the available CloudWatch metrics for your instances

Amazon EC2 sends metrics to Amazon CloudWatch. You can use the AWS Management Console, the AWS CLI, or an API to list the metrics that Amazon EC2 sends to CloudWatch. By default, each data point covers the 5 minutes that follow the start time of activity for the instance. If you've enabled detailed monitoring, each data point covers the next minute of activity from the start time. Note that for the Minimum, Maximum, and Average statistics, the minimum granularity for the metrics that EC2 provides is 1 minute.

For information about getting the statistics for these metrics, see [Get statistics for metrics for your instances \(p. 1198\)](#).

Contents

- [Instance metrics \(p. 1185\)](#)
- [CPU credit metrics \(p. 1189\)](#)
- [Dedicated Host metrics \(p. 1190\)](#)

- [List metrics using the AWS CLI \(p. 1197\)](#)

Instance metrics

The AWS/EC2 namespace includes the following instance metrics.

Metric	Description
CPUUtilization	<p>The percentage of physical CPU time that Amazon EC2 uses to run the EC2 instance, which includes time spent to run both the user code and the Amazon EC2 code.</p> <p>At a very high level, CPUUtilization is the sum of guest CPUUtilization and hypervisor CPUUtilization.</p> <p>Tools in your operating system can show a different percentage than CloudWatch due to factors such as legacy device simulation, configuration of non-legacy devices, interrupt-heavy workloads, live migration, and live update.</p> <p>Units: Percent</p>
DiskReadOps	<p>Completed read operations from all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Count</p>
DiskWriteOps	<p>Completed write operations to all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Count</p>
DiskReadBytes	<p>Bytes read from all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application reads from the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed DiskReadBytes in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p>

Metric	Description
	<p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Bytes</p>
DiskWriteBytes	<p>Bytes written to all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application writes onto the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed DiskWriteBytes in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Bytes</p>
MetadataNoToken	<p>The number of times the Instance Metadata Service was successfully accessed using a method that does not use a token.</p> <p>This metric is used to determine if there are any processes accessing instance metadata that are using Instance Metadata Service Version 1, which does not use a token. If all requests use token-backed sessions, i.e., Instance Metadata Service Version 2, the value is 0. For more information, see Transition to using Instance Metadata Service Version 2 (p. 865).</p> <p>Units: Count</p>
NetworkIn	<p>The number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed NetworkIn in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Units: Bytes</p>

Metric	Description
NetworkOut	<p>The number of bytes sent out by the instance on all network interfaces. This metric identifies the volume of outgoing network traffic from a single instance.</p> <p>The number reported is the number of bytes sent during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed NetworkOut in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Units: Bytes</p>
NetworkPacketsIn	<p>The number of packets received by the instance on all network interfaces. This metric identifies the volume of incoming traffic in terms of the number of packets on a single instance.</p> <p>This metric is available for basic monitoring only (5-minute periods). To calculate the number of packets per second (PPS) your instance received for the 5 minutes, divide the Sum statistic value by 300. You can also use the CloudWatch metric math function DIFF_TIME to find the packets per second. For example, if you have graphed NetworkPacketsIn in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in packets/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Units: Count</p>
NetworkPacketsOut	<p>The number of packets sent out by the instance on all network interfaces. This metric identifies the volume of outgoing traffic in terms of the number of packets on a single instance.</p> <p>This metric is available for basic monitoring only (5-minute periods). To calculate the number of packets per second (PPS) your instance sent for the 5 minutes, divide the Sum statistic value by 300. You can also use the CloudWatch metric math function DIFF_TIME to find the packets per second. For example, if you have graphed NetworkPacketsOut in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in packets/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Units: Count</p>

CPU credit metrics

The AWS/EC2 namespace includes the following CPU credit metrics for your [burstable performance instances \(p. 245\)](#).

Metric	Description
CPUCreditUsage	<p>The number of CPU credits spent by the instance for CPU utilization. One CPU credit equals one vCPU running at 100% utilization for one minute or an equivalent combination of vCPUs, utilization, and time (for example, one vCPU running at 50% utilization for two minutes or two vCPUs running at 25% utilization for two minutes).</p> <p>CPU credit metrics are available at a 5-minute frequency only. If you specify a period greater than five minutes, use the Sum statistic instead of the Average statistic.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUCreditBalance	<p>The number of earned CPU credits that an instance has accrued since it was launched or started. For T2 Standard, the CPUCreditBalance also includes the number of launch credits that have been accrued.</p> <p>Credits are accrued in the credit balance after they are earned, and removed from the credit balance when they are spent. The credit balance has a maximum limit, determined by the instance size. After the limit is reached, any new credits that are earned are discarded. For T2 Standard, launch credits do not count towards the limit.</p> <p>The credits in the CPUCreditBalance are available for the instance to spend to burst beyond its baseline CPU utilization.</p> <p>When an instance is running, credits in the CPUCreditBalance do not expire. When a T3 or T3a instance stops, the CPUCreditBalance value persists for seven days. Thereafter, all accrued credits are lost. When a T2 instance stops, the CPUCreditBalance value does not persist, and all accrued credits are lost.</p> <p>CPU credit metrics are available at a 5-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUSurplusCreditBalance	<p>The number of surplus credits that have been spent by an unlimited instance when its CPUCreditBalance value is zero.</p> <p>The CPUSurplusCreditBalance value is paid down by earned CPU credits. If the number of surplus credits exceeds the maximum number of credits that the instance can earn in a 24-hour period, the spent surplus credits above the maximum incur an additional charge.</p> <p>CPU credit metrics are available at a 5-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>

Metric	Description
CPUSurplusCreditsCharged	<p>The number of spent surplus credits that are not paid down by earned CPU credits, and which thus incur an additional charge.</p> <p>Spent surplus credits are charged when any of the following occurs:</p> <ul style="list-style-type: none"> • The spent surplus credits exceed the maximum number of credits that the instance can earn in a 24-hour period. Spent surplus credits above the maximum are charged at the end of the hour. • The instance is stopped or terminated. • The instance is switched from unlimited to standard. <p>CPU credit metrics are available at a 5-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>

Dedicated Host metrics

The AWS/EC2 namespace includes the following metrics for T3 Dedicated Hosts.

Metric	Description
DedicatedHostCPUUtilization	<p>The percentage of allocated compute capacity that is currently in use by the instances running on the Dedicated Host.</p> <p>Unit: Percent</p>

Amazon EBS metrics for Nitro-based instances

The AWS/EC2 namespace includes the following Amazon EBS metrics for the Nitro-based instances. For the list of Nitro-based instance types, see [Instances built on the Nitro System \(p. 218\)](#).

Metric	Description
EBSReadOps	<p>Completed read operations from all Amazon EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average read I/O operations per second (Read IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to calculate the Read IOPS. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the operations per second. For example, if you have graphed EBSReadOps in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in operations/second. For more information about DIFF_TIME and</p>

Metric	Description
	<p>other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Unit: Count</p>
EBSWriteOps	<p>Completed write operations to all EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average write I/O operations per second (Write IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to calculate the Write IOPS. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the operations per second. For example, if you have graphed EBSWriteOps in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in operations/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Unit: Count</p>
EBSReadBytes	<p>Bytes read from all EBS volumes attached to the instance in a specified period of time.</p> <p>The number reported is the number of bytes read during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Read Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed EBSReadBytes in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Unit: Bytes</p>

Metric	Description
EBSWriteBytes	<p>Bytes written to all EBS volumes attached to the instance in a specified period of time.</p> <p>The number reported is the number of bytes written during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Write Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed EBSWriteBytes in CloudWatch as m1, the metric math formula $m1 / (\text{DIFF_TIME}(m1))$ returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the <i>Amazon CloudWatch User Guide</i>.</p> <p>Unit: Bytes</p>
EBSIOBalance%	<p>Provides information about the percentage of I/O credits remaining in the burst bucket. This metric is available for basic monitoring only.</p> <p>This metric is available only for some *.4xlarge instance sizes and smaller that burst to their maximum performance for only 30 minutes at least once every 24 hours. For a complete list of instance sizes that support this metric, see the instances types indicated with an asterisk (*) in the Instance size column in the EBS optimized by default (p. 1942) table.</p> <p>The Sum statistic is not applicable to this metric.</p> <p>Unit: Percent</p>
EBSByteBalance%	<p>Provides information about the percentage of throughput credits remaining in the burst bucket. This metric is available for basic monitoring only.</p> <p>This metric is available only for some *.4xlarge instance sizes and smaller that burst to their maximum performance for only 30 minutes at least once every 24 hours. For a complete list of instance sizes that support this metric, see the instances types indicated with an asterisk (*) in the Instance size column in the EBS optimized by default (p. 1942) table.</p> <p>The Sum statistic is not applicable to this metric.</p> <p>Unit: Percent</p>

For information about the metrics provided for your EBS volumes, see [Amazon EBS metrics \(p. 1979\)](#).
 For information about the metrics provided for your Spot fleets, see [CloudWatch metrics for Spot Fleet \(p. 1071\)](#).

Status check metrics

The AWS/EC2 namespace includes the following status check metrics. By default, status check metrics are available at a 1-minute frequency at no charge. For a newly-launched instance, status check metric data is only available after the instance has completed the initialization state (within a few minutes of the instance entering the running state). For more information about EC2 status checks, see [Status checks for your instances \(p. 1153\)](#).

Metric	Description
StatusCheckFailed	<p>Reports whether the instance has passed both the instance status check and the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>
StatusCheckFailed_Instance	<p>Reports whether the instance has passed the instance status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>
StatusCheckFailed_System	<p>Reports whether the instance has passed the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>

Traffic mirroring metrics

The AWS/EC2 namespace includes metrics for mirrored traffic. For more information, see [Monitor mirrored traffic using Amazon CloudWatch](#) in the *Amazon VPC Traffic Mirroring Guide*.

Auto Scaling group metrics

The AWS/AutoScaling namespace includes metrics for Auto Scaling groups. For more information, see [Monitor CloudWatch metrics for your Auto Scaling groups and instances](#) in the *Amazon EC2 Auto Scaling User Guide*.

Amazon EC2 metric dimensions

You can use the following dimensions to refine the metrics listed in the previous tables.

Dimension	Description
AutoScalingGroupName	This dimension filters the data you request for all instances in a specified capacity group. An <i>Auto Scaling group</i> is a collection of instances you define if you're using Auto Scaling. This dimension is available only for Amazon EC2 metrics when the instances are in such an Auto Scaling group. Available for instances with Detailed or Basic Monitoring enabled.
ImageId	This dimension filters the data you request for all instances running this Amazon EC2 Amazon Machine Image (AMI). Available for instances with Detailed Monitoring enabled.
InstanceId	This dimension filters the data you request for the identified instance only. This helps you pinpoint an exact instance from which to monitor data.
InstanceType	This dimension filters the data you request for all instances running with this specified instance type. This helps you categorize your data by the type of instance running. For example, you might compare data from an m1.small instance and an m1.large instance to determine which has the better business value for your application. Available for instances with Detailed Monitoring enabled.

Amazon EC2 usage metrics

You can use CloudWatch usage metrics to provide visibility into your account's usage of resources. Use these metrics to visualize your current service usage on CloudWatch graphs and dashboards.

Amazon EC2 usage metrics correspond to AWS service quotas. You can configure alarms that alert you when your usage approaches a service quota. For more information about CloudWatch integration with service quotas, see [AWS usage metrics](#) in the *Amazon CloudWatch User Guide*.

Amazon EC2 publishes the following metrics in the AWS/Usage namespace.

Metric	Description
ResourceCount	The number of the specified resources running in your account. The resources are defined by the dimensions associated with the metric. The most useful statistic for this metric is MAXIMUM, which represents the maximum number of resources used during the 1-minute period.

The following dimensions are used to refine the usage metrics that are published by Amazon EC2.

Dimension	Description
Service	The name of the AWS service containing the resource. For Amazon EC2 usage metrics, the value for this dimension is EC2.
Type	The type of entity that is being reported. Currently, the only valid value for Amazon EC2 usage metrics is Resource.

Dimension	Description
Resource	The type of resource that is running. Currently, the only valid value for Amazon EC2 usage metrics is vCPU, which returns information on instances that are running.
Class	<p>The class of resource being tracked. For Amazon EC2 usage metrics with vCPU as the value of the Resource dimension, the valid values are Standard/OnDemand, F/OnDemand, G/OnDemand, Inf/OnDemand, P/OnDemand, and X/OnDemand.</p> <p>The values for this dimension define the first letter of the instance types that are reported by the metric. For example, Standard/OnDemand returns information about all running instances with types that start with A, C, D, H, I, M, R, T, and Z, and G/OnDemand returns information about all running instances with types that start with G.</p>

List metrics using the console

Metrics are grouped first by namespace, and then by the various dimension combinations within each namespace. For example, you can view all metrics provided by Amazon EC2, or metrics grouped by instance ID, instance type, image (AMI) ID, or Auto Scaling group.

To view available metrics by category (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.

722 Metrics

EBS	EC2
117 Metrics	316 Metrics
EFS	ELB
7 Metrics	210 Metrics
ElasticBeanstalk	RDS
8 Metrics	60 Metrics
S3	
4 Metrics	

4. Select a metric dimension (for example, **Per-Instance Metrics**).

The screenshot shows the AWS CloudWatch Metrics console with the following interface elements:

- Top Navigation:** All > EC2 > Search bar.
- Metric Categories:**
 - By Auto Scaling Group:** 28 Metrics
 - By Image (AMI) Id:** 7 Metrics
 - Per-Instance Metrics:** 54 Metrics
 - Aggregated by Instance Type:** 7 Metrics
 - Across All Instances:** 7 Metrics

- To sort the metrics, use the column heading. To graph a metric, select the check box next to the metric. To filter by resource, choose the resource ID and then choose **Add to search**. To filter by metric, choose the metric name and then choose **Add to search**.

The screenshot shows the AWS CloudWatch Metrics console with the following interface elements:

- Top Navigation:** All > EC2 > Per-Instance Metrics > Search bar.
- Metric Table:**

	Instance Name (192)	InstanceId	Metric Name
<input type="checkbox"/>	my-instance	i-abbc12a7	CPUUtilization
<input type="checkbox"/>	my-instance		DiskReadBytes
<input type="checkbox"/>	my-instance		DiskReadOps
<input type="checkbox"/>	my-instance		DiskWriteBytes
<input type="checkbox"/>	my-instance		DiskWriteOps
<input type="checkbox"/>	my-instance		NetworkIn
<input type="checkbox"/>	my-instance		NetworkOut
<input type="checkbox"/>	my-instance	i-abbc12a7	NetworkPacketsIn
<input type="checkbox"/>	my-instance	i-abbc12a7	NetworkPacketsOut
- Context Menu (Open over first row):**
 - Add to search
 - Search for this only
 - Add to graph
 - Graph this metric only
 - Graph all search results
 - Jump to resource

List metrics using the AWS CLI

Use the [list-metrics](#) command to list the CloudWatch metrics for your instances.

To list all the available metrics for Amazon EC2 (AWS CLI)

The following example specifies the AWS/EC2 namespace to view all the metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

The following is example output:

```
{  
    "Metrics": [  
        {  
            "Namespace": "AWS/EC2",  
            "Dimensions": [  
                {  
                    "Name": "InstanceId",  
                    "Value": "i-1234567890abcdef0"  
                }  
            ],  
            "MetricName": "NetworkOut"  
        },  
        {  
            "Namespace": "AWS/EC2",  
            "Dimensions": [  
                {  
                    "Name": "InstanceId",  
                    "Value": "i-1234567890abcdef0"  
                }  
            ],  
            "MetricName": "CPUUtilization"  
        },  
        {  
            "Namespace": "AWS/EC2",  
            "Dimensions": [  
                {  
                    "Name": "InstanceId",  
                    "Value": "i-1234567890abcdef0"  
                }  
            ],  
            "MetricName": "NetworkIn"  
        },  
        ...  
    ]  
}
```

To list all the available metrics for an instance (AWS CLI)

The following example specifies the AWS/EC2 namespace and the InstanceId dimension to view the results for the specified instance only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --dimensions  
    Name=InstanceId,Value=i-1234567890abcdef0
```

To list a metric across all instances (AWS CLI)

The following example specifies the AWS/EC2 namespace and a metric name to view the results for the specified metric only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --metric-name CPUUtilization
```

Get statistics for metrics for your instances

You can get statistics for the CloudWatch metrics for your instances.

Contents

- [Statistics overview \(p. 1198\)](#)
- [Get statistics for a specific instance \(p. 1198\)](#)
- [Aggregate statistics across instances \(p. 1202\)](#)
- [Aggregate statistics by Auto Scaling group \(p. 1204\)](#)
- [Aggregate statistics by AMI \(p. 1205\)](#)

Statistics overview

Statistics are metric data aggregations over specified periods of time. CloudWatch provides statistics based on the metric data points provided by your custom data or provided by other services in AWS to CloudWatch. Aggregations are made using the namespace, metric name, dimensions, and the data point unit of measure, within the time period you specify. The following table describes the available statistics.

Statistic	Description
Minimum	The lowest value observed during the specified period. You can use this value to determine low volumes of activity for your application.
Maximum	The highest value observed during the specified period. You can use this value to determine high volumes of activity for your application.
Sum	All values submitted for the matching metric added together. This statistic can be useful for determining the total volume of a metric.
Average	The value of Sum / SampleCount during the specified period. By comparing this statistic with the Minimum and Maximum, you can determine the full scope of a metric and how close the average use is to the Minimum and Maximum. This comparison helps you to know when to increase or decrease your resources as needed.
SampleCount	The count (number) of data points used for the statistical calculation.
pNN.NN	The value of the specified percentile. You can specify any percentile, using up to two decimal places (for example, p95.45).

Get statistics for a specific instance

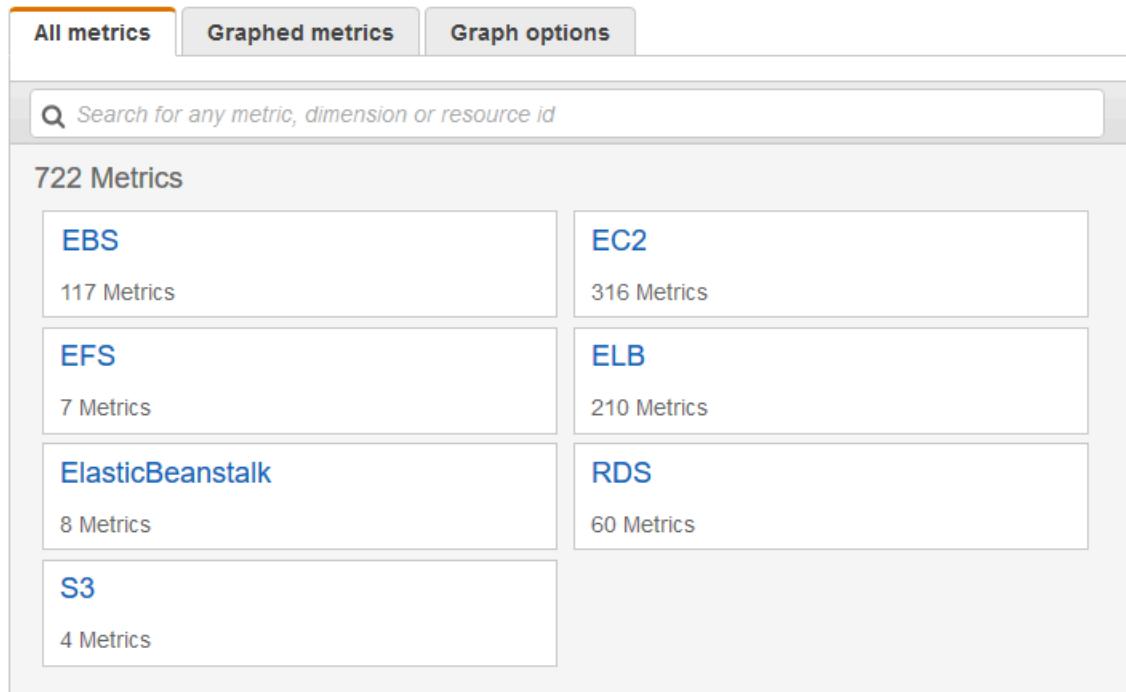

The following examples show you how to use the AWS Management Console or the AWS CLI to determine the maximum CPU utilization of a specific EC2 instance.

Requirements

- You must have the ID of the instance. You can get the instance ID using the AWS Management Console or the [describe-instances](#) command.
- By default, basic monitoring is enabled, but you can enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 1183\)](#).

To display the CPU utilization for a specific instance (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.

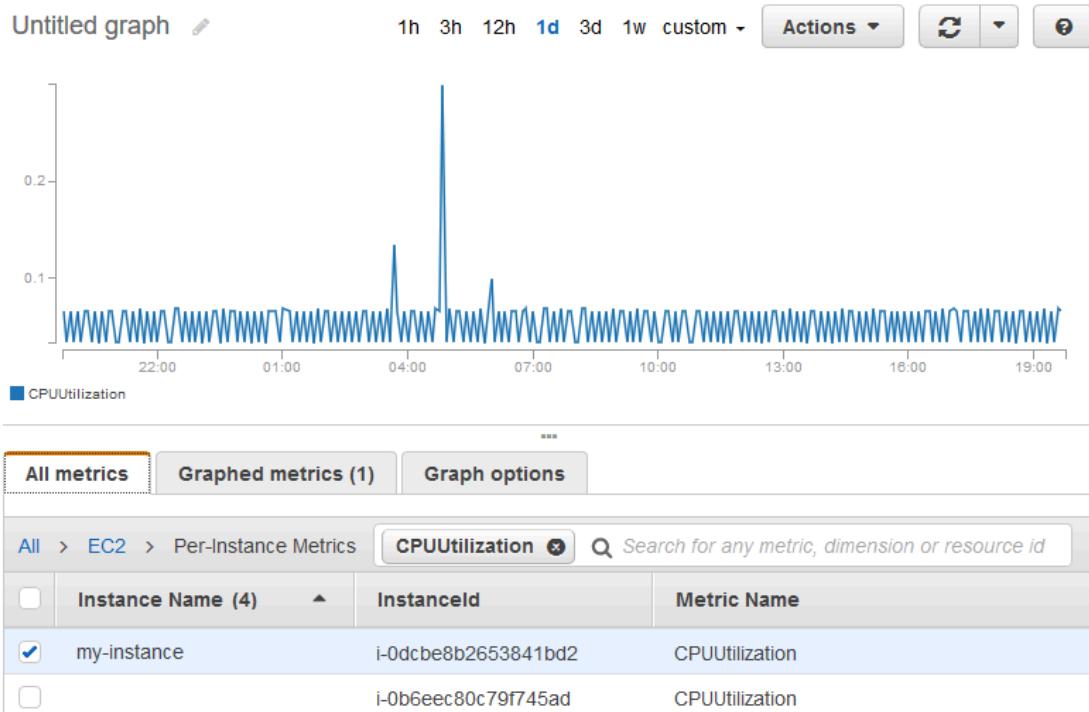

4. Choose the **Per-Instance Metrics** dimension.

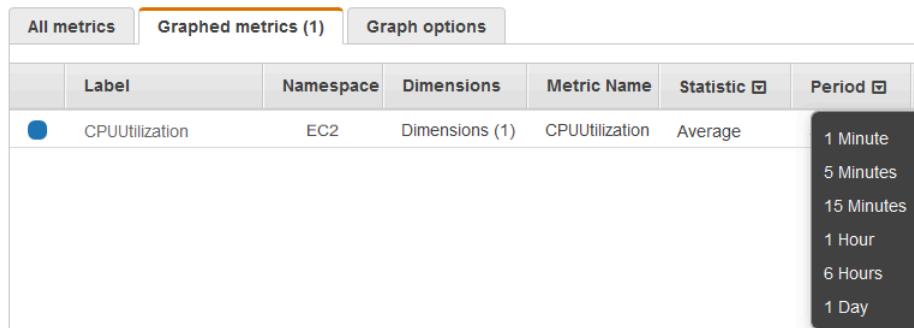

The screenshot shows the Amazon CloudWatch Metrics console interface. At the top, there are three tabs: "All metrics" (selected), "Graphed metrics", and "Graph options". Below the tabs, the navigation bar shows "All > EC2" and a search bar with the placeholder "Search for any metric, dimension or resource id". The main content area displays "103 Metrics" and lists them in five categories:

- By Auto Scaling Group**: 28 Metrics
- By Image (AMI) Id**: 7 Metrics
- Per-Instance Metrics**: 54 Metrics
- Aggregated by Instance Type**: 7 Metrics
- Across All Instances**: 7 Metrics

5. In the search field, enter **CPUUtilization** and press Enter. Choose the row for the specific instance, which displays a graph for the **CPUUtilization** metric for the instance. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

- To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the CPU utilization for a specific instance (AWS CLI)

Use the following [get-metric-statistics](#) command to get the **CPUUtilization** metric for the specified instance, using the specified period and time interval:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --period 3600 \
--statistics Maximum --dimensions Name=InstanceId,Value=i-1234567890abcdef0 \
--start-time 2022-10-18T23:18:00 --end-time 2022-10-19T23:18:00
```

The following is example output. Each value represents the maximum CPU utilization percentage for a single EC2 instance.

```
{
  "Datapoints": [
    {
```

```
"Timestamp": "2022-10-19T00:18:00Z",
"Maximum": 0.3300000000000002,
"Unit": "Percent"
},
{
"Timestamp": "2022-10-19T03:18:00Z",
"Maximum": 99.67000000000002,
"Unit": "Percent"
},
{
"Timestamp": "2022-10-19T07:18:00Z",
"Maximum": 0.3400000000000002,
"Unit": "Percent"
},
{
"Timestamp": "2022-10-19T12:18:00Z",
"Maximum": 0.3400000000000002,
"Unit": "Percent"
},
...
],
"Label": "CPUUtilization"
}
```

Aggregate statistics across instances

Aggregate statistics are available for instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics aggregated across instances, you must [enable detailed monitoring \(p. 1184\)](#) (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

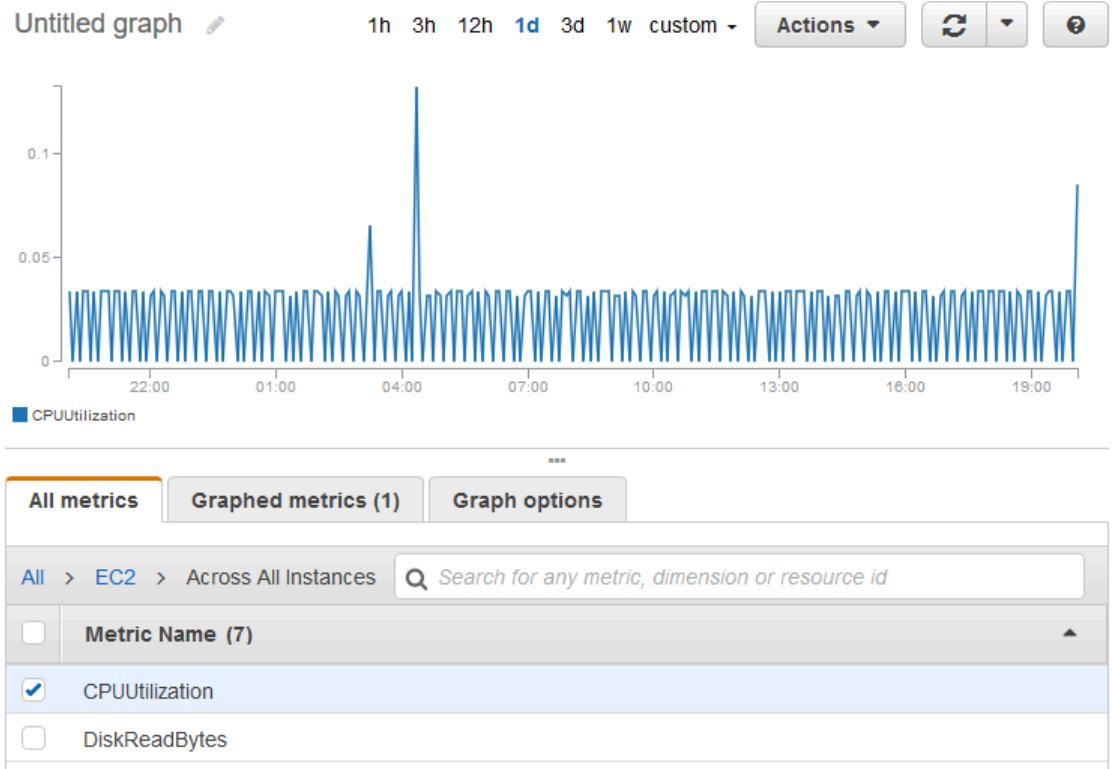

This example shows you how to use detailed monitoring to get the average CPU usage for your EC2 instances. Because no dimension is specified, CloudWatch returns statistics for all dimensions in the AWS/E2 namespace.

Important

This technique for retrieving all dimensions across an AWS namespace does not work for custom namespaces that you publish to Amazon CloudWatch. With custom namespaces, you must specify the complete set of dimensions that are associated with any given data point to retrieve statistics that include the data point.

To display average CPU utilization across your instances (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **Across All Instances**.
4. Choose the row that contains **CPUUtilization**, which displays a graph for the metric for all your EC2 instances. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

- To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get average CPU utilization across your instances (AWS CLI)

Use the [get-metric-statistics](#) command as follows to get the average of the **CPUUtilization** metric across your instances.

```
aws cloudwatch get-metric-statistics \
--namespace AWS/EC2 \
--metric-name CPUUtilization \
--period 3600 --statistics "Average" "SampleCount" \
--start-time 2022-10-11T23:18:00 \
--end-time 2022-10-12T23:18:00
```

The following is example output:

```
{
  "Datapoints": [
    {
      "SampleCount": 238.0,
      "Timestamp": "2022-10-12T07:18:00Z",
      "Average": 0.038235294117647062,
      "Unit": "Percent"
    },
    {
      "SampleCount": 240.0,
      "Timestamp": "2022-10-12T09:18:00Z",
      "Average": 0.1667083333333332,
      "Unit": "Percent"
    }
  ]
}
```

```
"SampleCount": 238.0,  
"Timestamp": "2022-10-11T23:18:00Z",  
"Average": 0.041596638655462197,  
"Unit": "Percent"  
},  
...  
],  
"Label": "CPUUtilization"  
}
```

Aggregate statistics by Auto Scaling group

You can aggregate statistics for the EC2 instances in an Auto Scaling group. Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to retrieve the total bytes written to disk for one Auto Scaling group. The total is computed for 1-minute periods for a 24-hour interval across all EC2 instances in the specified Auto Scaling group.

To display DiskWriteBytes for the instances in an Auto Scaling group (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Auto Scaling Group**.
4. Choose the row for the **DiskWriteBytes** metric and the specific Auto Scaling group, which displays a graph for the metric for the instances in the Auto Scaling group. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To display DiskWriteBytes for the instances in an Auto Scaling group (AWS CLI)

Use the [get-metric-statistics](#) command as follows.

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name DiskWriteBytes --  
period 360 \  
--statistics "Sum" "SampleCount" --dimensions Name=AutoScalingGroupName,Value=my-asg --  
start-time 2022-10-16T23:18:00 --end-time 2022-10-18T23:18:00
```

The following is example output:

```
{  
    "Datapoints": [  
        {  
            "SampleCount": 18.0,  
            "Timestamp": "2022-10-19T21:36:00Z",  
            "Sum": 0.0,  
            "Unit": "Bytes"  
        },  
        {  
            "SampleCount": 5.0,  
            "Timestamp": "2022-10-19T21:42:00Z",  
            "Sum": 0.0,  
            "Unit": "Bytes"  
        }  
    ],  
    "Label": "DiskWriteBytes"
```

}

Aggregate statistics by AMI

You can aggregate statistics for your instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics aggregated across instances, you must [enable detailed monitoring \(p. 1184\)](#) (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to determine average CPU utilization for all instances that use a specific Amazon Machine Image (AMI). The average is over 60-second time intervals for a one-day period.

To display the average CPU utilization by AMI (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Image (AMI) Id**.
4. Choose the row for the **CPUUtilization** metric and the specific AMI, which displays a graph for the metric for the specified AMI. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the average CPU utilization for an image ID (AWS CLI)

Use the [get-metric-statistics](#) command as follows.

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --period 3600 \
--statistics Average --dimensions Name=ImageId,Value=ami-3c47a355 --start-time 2022-10-10T00:00:00 --end-time 2022-10-11T00:00:00
```

The following is example output. Each value represents an average CPU utilization percentage for the EC2 instances running the specified AMI.

```
{
  "Datapoints": [
    {
      "Timestamp": "2022-10-10T07:00:00Z",
      "Average": 0.04100000000000009,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2022-10-10T14:00:00Z",
      "Average": 0.079579831932773085,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2022-10-10T06:00:00Z",
      "Average": 0.03600000000000011,
      "Unit": "Percent"
    },
    ...
  ],
}
```

```
    "Label": "CPUUtilization"  
}
```

Graph metrics for your instances

After you launch an instance, you can open the Amazon EC2 console and view the monitoring graphs for the instance on the **Monitoring** tab. Each graph is based on one of the available Amazon EC2 metrics.

The following graphs are available:

- Average CPU Utilization (Percent)
- Average Disk Reads (Bytes)
- Average Disk Writes (Bytes)
- Maximum Network In (Bytes)
- Maximum Network Out (Bytes)
- Summary Disk Read Operations (Count)
- Summary Disk Write Operations (Count)
- Summary Status (Any)
- Summary Status Instance (Count)
- Summary Status System (Count)

For more information about the metrics and the data they provide to the graphs, see [List the available CloudWatch metrics for your instances \(p. 1185\)](#).

Graph metrics using the CloudWatch console

You can also use the CloudWatch console to graph metric data generated by Amazon EC2 and other AWS services. For more information, see [Graphing metrics](#) in the *Amazon CloudWatch User Guide*.

Create a CloudWatch alarm for an instance

You can create a CloudWatch alarm that monitors CloudWatch metrics for one of your instances. CloudWatch will automatically send you a notification when the metric reaches a threshold you specify. You can create a CloudWatch alarm using the Amazon EC2 console, or using the more advanced options provided by the CloudWatch console.

To create an alarm using the CloudWatch console

For examples, see [Creating Amazon CloudWatch Alarms](#) in the *Amazon CloudWatch User Guide*.

To create an alarm using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.
4. On the **Manage CloudWatch alarms** detail page, under **Add or edit alarm**, select **Create an alarm**.
5. For **Alarm notification**, choose whether to turn the toggle on or off to configure Amazon Simple Notification Service (Amazon SNS) notifications. Enter an existing Amazon SNS topic or enter a name to create a new topic.
6. For **Alarm action**, choose whether to turn the toggle on or off to specify an action to take when the alarm is triggered. Select an action from the dropdown.

7. For **Alarm thresholds**, select the metric and criteria for the alarm. For example, you can leave the default settings for **Group samples by (Average)** and **Type of data to sample (CPU utilization)**. For **Alarm when**, choose \geq and enter **0.80**. For **Consecutive period**, enter **1**. For **Period**, select **5 minutes**.
8. (Optional) For **Sample metric data**, choose **Add to dashboard**.
9. Choose **Create**.

You can edit your CloudWatch alarm settings from the Amazon EC2 console or the CloudWatch console. If you want to delete your alarm, you can do so from the CloudWatch console. For more information, see [Editing or deleting a CloudWatch alarm](#) in the *Amazon CloudWatch User Guide*.

Create alarms that stop, terminate, reboot, or recover an instance

Using Amazon CloudWatch alarm actions, you can create alarms that automatically stop, terminate, reboot, or recover your instances. You can use the stop or terminate actions to help you save money when you no longer need an instance to be running. You can use the reboot and recover actions to automatically reboot those instances or recover them onto new hardware if a system impairment occurs.

The `AWSLambdaRoleForCloudWatchEvents` service-linked role enables AWS to perform alarm actions on your behalf. The first time you create an alarm in the AWS Management Console, the AWS CLI, or the IAM API, CloudWatch creates the service-linked role for you.

There are a number of scenarios in which you might want to automatically stop or terminate your instance. For example, you might have instances dedicated to batch payroll processing jobs or scientific computing tasks that run for a period of time and then complete their work. Rather than letting those instances sit idle (and accrue charges), you can stop or terminate them, which can help you to save money. The main difference between using the stop and the terminate alarm actions is that you can easily start a stopped instance if you need to run it again later, and you can keep the same instance ID and root volume. However, you cannot start a terminated instance. Instead, you must launch a new instance. When an instance is stopped or terminated, data on instance store volumes is lost.

You can add the stop, terminate, reboot, or recover actions to any alarm that is set on an Amazon EC2 per-instance metric, including basic and detailed monitoring metrics provided by Amazon CloudWatch (in the AWS/EC2 namespace), as well as any custom metrics that include the `InstanceId` dimension, as long as its value refers to a valid running Amazon EC2 instance.

Console support

You can create alarms using the Amazon EC2 console or the CloudWatch console. The procedures in this documentation use the Amazon EC2 console. For procedures that use the CloudWatch console, see [Create alarms that stop, terminate, reboot, or recover an instance](#) in the *Amazon CloudWatch User Guide*.

Permissions

You must have the `iam:CreateServiceLinkedRole` to create or modify an alarm that performs EC2 alarm actions. A service role is an [IAM role](#) that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.

Add stop actions to Amazon CloudWatch alarms

You can create an alarm that stops an Amazon EC2 instance when a certain threshold has been met. For example, you may run development or test instances and occasionally forget to shut them off. You can create an alarm that is triggered when the average CPU utilization percentage has been lower than 10 percent for 24 hours, signaling that it is idle and no longer in use. You can adjust the threshold, duration, and period to suit your needs, plus you can add an Amazon Simple Notification Service (Amazon SNS) notification so that you receive an email when the alarm is triggered.

Instances that use an Amazon EBS volume as the root device can be stopped or terminated, whereas instances that use the instance store as the root device can only be terminated. Data on instance store volumes is lost when the instance is terminated or stopped.

To create an alarm to stop an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Stop**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.
 - e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify **<=** and **10** percent.
 - f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **1 consecutive period of 5 Minutes**.
 - g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- h. Choose **Create**.

Add terminate actions to Amazon CloudWatch alarms

You can create an alarm that terminates an EC2 instance automatically when a certain threshold has been met (as long as termination protection is not enabled for the instance). For example, you might want to terminate an instance when it has completed its work, and you don't need the instance again.

If you might want to use the instance later, you should stop the instance instead of terminating it. Data on instance store volumes is lost when the instance is terminated. For information about enabling and disabling termination protection for an instance, see [Enable termination protection \(p. 618\)](#).

To create an alarm to terminate an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Terminate**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.
 - e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify => and **10 percent**.
 - f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **24 consecutive periods of 1 Hour**.
 - g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- h. Choose **Create**.

Add reboot actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically reboots the instance. The reboot alarm action is recommended for Instance Health Check failures (as opposed to the recover alarm action, which is suited for System Health Check failures). An instance reboot is equivalent to an operating system reboot. In most cases, it takes only a few minutes to reboot your instance. When you reboot an instance, it remains on the same physical host, so your instance keeps its public DNS name, private IP address, and any data on its instance store volumes.

Rebooting an instance doesn't start a new instance billing period (with a minimum one-minute charge), unlike stopping and restarting your instance. Data on instance store volumes is retained when the instance is rebooted. The instance store volumes must be re-mounted into the filesystem after a reboot. For more information, see [Reboot your instance \(p. 612\)](#).

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set reboot alarms to three evaluation periods of one minute each. For more information, see [Evaluating an alarm](#) in the *Amazon CloudWatch User Guide*.

To create an alarm to reboot an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Reboot**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **Status check failed: instance**.
 - e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter **3 consecutive periods of 5 Minutes**.
 - f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.
 - g. Choose **Create**.

Add recover actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance. If the instance becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair, you can automatically recover the instance. Terminated instances cannot be recovered. A recovered instance is identical to the original instance, including the instance ID, private IP addresses, Elastic IP addresses, and all instance metadata.

CloudWatch prevents you from adding a recovery action to an alarm that is on an instance which does not support recovery actions.

When the `StatusCheckFailed_System` alarm is triggered, and the recover action is initiated, you are notified by the Amazon SNS topic that you chose when you created the alarm and associated the recover action. During instance recovery, the instance is migrated during an instance reboot, and any data that is in-memory is lost. When the process is complete, information is published to the SNS topic you've configured for the alarm. Anyone who is subscribed to this SNS topic receives an email notification that includes the status of the recovery attempt and any further instructions. You notice an instance reboot on the recovered instance.

Note

The recover action can be used only with `StatusCheckFailed_System`, not with `StatusCheckFailed_Instance`.

The following problems can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

The recover action is supported only on instances that meet certain characteristics. For more information, see [Recover your instance](#).

If your instance has a public IP address, it retains the public IP address after recovery.

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set recover alarms to two evaluation periods of one minute each. For more information, see [Evaluating an alarm](#) in the *Amazon CloudWatch User Guide*.

To create an alarm to recover an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.

Note

Users must subscribe to the specified SNS topic to receive email notifications when the alarm is triggered. The AWS account root user always receives email notifications when automatic instance recovery actions occur, even if an SNS topic is not specified or the root user is not subscribed to the specified SNS topic.

- c. Toggle on **Alarm action**, and choose **Recover**.
- d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **Status check failed: system**.
- e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter **2 consecutive periods of 5 Minutes**.
- f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.
- g. Choose **Create**.

Use the Amazon CloudWatch console to view alarm and action history

You can view alarm and action history in the Amazon CloudWatch console. Amazon CloudWatch keeps the last two weeks' worth of alarm and action history.

To view the history of triggered alarms and actions (CloudWatch console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Select an alarm.
4. The **Details** tab shows the most recent state transition along with the time and metric values.
5. Choose the **History** tab to view the most recent history entries.

Amazon CloudWatch alarm action scenarios

You can use the Amazon EC2 console to create alarm actions that stop or terminate an Amazon EC2 instance when certain conditions are met. In the following screen capture of the console page where you set the alarm actions, we've numbered the settings. We've also numbered the settings in the scenarios that follow, to help you create the appropriate actions.

New console

Alarm notification Info

Configure the alarm to send notifications to an Amazon SNS topic when it is triggered.

Choose an existing topic or enter a name to create a new topic

1

Alarm action Info

Specify the action to take when the alarm is triggered.

Selection action to alarm fires

Alarm thresholds

Specify the metric thresholds for the alarm.

Group samples by **2** Age Type of data to sample **3**

Alarm When **4** **5**

Consecutive Period **6** Period **7** minutes

Alarm name awsec2-i-04a2b95d0495ac1ee-GreaterThanOrEqualToThreshold-

Old console

The screenshot shows the 'Create Alarm' dialog box. At the top, it says 'Create Alarm' and has a close button 'X'. Below that, a message says: 'You can use CloudWatch alarms to be notified automatically whenever metric data reaches a level you define. To edit an alarm, first choose whom to notify and then define when the notification should be sent.' There are two main sections: 'Send a notification to:' and 'Take the action:'. Under 'Send a notification to:', there is a checkbox 'Send a notification to:' followed by a dropdown menu 'create topic'. Under 'Take the action:', there is a checkbox 'Take the action:' followed by four radio buttons: 'Recover this instance', 'Stop this instance', 'Terminate this instance', and 'Reboot this instance'. Below these sections are three input fields: 'Whenever:' (with dropdowns for '2' and 'of' '3'), 'Is:' (with dropdowns for '4' and '5'), and 'Percent'. Below that is another field 'For at least:' (with dropdowns for '6' and '7'). At the bottom, there is a 'Name of alarm:' input field, a 'Cancel' button, and a 'Create Alarm' button.

Scenario 1: Stop idle development and test instances

Create an alarm that stops an instance used for software development or testing when it has been idle for at least an hour.

Setting	Value
1	Stop
2	Maximum
3	CPU Utilization
4	<=
5	10%
6	1
7	1 Hour

Scenario 2: Stop idle instances

Create an alarm that stops an instance and sends an email when the instance has been idle for 24 hours.

Setting	Value
1	Stop and email
2	Average
3	CPU Utilization
4	<=
5	5%

Setting	Value
6	24
7	1 Hour

Scenario 3: Send email about web servers with unusually high traffic

Create an alarm that sends email when an instance exceeds 10 GB of outbound network traffic per day.

Setting	Value
1	Email
2	Sum
3	Network Out
4	>
5	10 GB
6	24
7	1 Hour

Scenario 4: Stop web servers with unusually high traffic

Create an alarm that stops an instance and send a text message (SMS) if outbound traffic exceeds 1 GB per hour.

Setting	Value
1	Stop and send SMS
2	Sum
3	Network Out
4	>
5	1 GB
6	1
7	1 Hour

Scenario 5: Stop an impaired instance

Create an alarm that stops an instance that fails three consecutive status checks (performed at 5-minute intervals).

Setting	Value
1	Stop

Setting	Value
2	Average
3	Status Check Failed: System
4	-
5	-
6	1
7	15 Minutes

Scenario 6: Terminate instances when batch processing jobs are complete

Create an alarm that terminates an instance that runs batch jobs when it is no longer sending results data.

Setting	Value
1	Terminate
2	Maximum
3	Network Out
4	<=
5	100,000 bytes
6	1
7	5 Minutes

Automate Amazon EC2 using EventBridge

You can use Amazon EventBridge to automate your AWS services and respond automatically to system events, such as application availability issues or resource changes. Events from AWS services are delivered to EventBridge in near real time. You can create rules to indicate which events you're interested in, and the actions to take when an event matches a rule. The actions that can be automatically triggered include the following:

- Invoke an AWS Lambda function
- Invoke Amazon EC2 Run Command
- Relay the event to Amazon Kinesis Data Streams
- Activate an AWS Step Functions state machine
- Notify an Amazon SNS topic
- Notify an Amazon SQS queue

The following are examples of how you can use EventBridge with Amazon EC2:

- Activate a Lambda function whenever an instance enters the running state.

- Notify an Amazon SNS topic when an Amazon EBS volume is created or modified.
- Send a command to one or more Amazon EC2 instances using Amazon EC2 Run Command whenever a certain event in another AWS service occurs.

For more information, see the [Amazon EventBridge User Guide](#).

Amazon EC2 event types

Amazon EC2 supports the following event types:

- [EC2 AMI State Change \(p. 198\)](#)
- [EC2 Fast Launch State-change Notification \(p. 52\)](#)
- [EC2 Fleet Error \(p. 1083\)](#)
- [EC2 Fleet Information \(p. 1083\)](#)
- [EC2 Fleet Instance Change \(p. 1082\)](#)
- [EC2 Fleet Spot Instance Request Change \(p. 1081\)](#)

For information about the event types supported by Amazon EBS, see [the section called "EBS EventBridge events" \(p. 1985\)](#).

Log Amazon EC2 and Amazon EBS API calls with AWS CloudTrail

Amazon EC2 and Amazon EBS are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2 and Amazon EBS. CloudTrail captures all API calls for Amazon EC2 and Amazon EBS as events, including calls from the console and from code calls to the APIs. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Amazon EC2 and Amazon EBS. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to Amazon EC2 and Amazon EBS, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the [AWS CloudTrail User Guide](#).

Amazon EC2 and Amazon EBS information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon EC2 and Amazon EBS, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing events with CloudTrail Event history](#).

For an ongoing record of events in your AWS account, including events for Amazon EC2 and Amazon EBS, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see:

- [Creating a trail for your AWS account](#)
 - [AWS service integrations with CloudTrail logs](#)
 - [Configuring Amazon SNS notifications for CloudTrail](#)
 - [Receiving CloudTrail log files from multiple Regions](#) and [Receiving CloudTrail log files from multiple accounts](#)

All Amazon EC2 actions, and Amazon EBS management actions, are logged by CloudTrail and are documented in the [Amazon EC2 API Reference](#). For example, calls to the [RunInstances](#), [DescribeInstances](#), or [CreateImage](#) actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or IAM user credentials.
 - Whether the request was made with temporary security credentials for a role or federated user.
 - Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentity element](#).

Understand Amazon EC2 and Amazon EBS log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following log file record shows that a user terminated an instance.

```
{  
  "Records": [  
    {  
      "eventVersion": "1.03",  
      "userIdentity": {  
        "type": "Root",  
        "principalId": "123456789012",  
        "arn": "arn:aws:iam::123456789012:root",  
        "sessionContext": {  
          "attributes": {}  
        }  
      }  
    }  
  ]  
}
```

```
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",

```

Use AWS CloudTrail to audit users that connect via EC2 Instance Connect

Use AWS CloudTrail to audit the users that connect to your instances via EC2 Instance Connect.

To audit SSH activity via EC2 Instance Connect using the AWS CloudTrail console

1. Open the AWS CloudTrail console at <https://console.aws.amazon.com/cloudtrail/>.
2. Verify that you are in the correct Region.
3. In the navigation pane, choose **Event history**.
4. For **Filter**, choose **Event source**, **ec2-instance-connect.amazonaws.com**.
5. (Optional) For **Time range**, select a time range.
6. Choose the **Refresh events** icon.
7. The page displays the events that correspond to the [SendSSHPublicKey](#) API calls. Expand an event using the arrow to view additional details, such as the user name and AWS access key that was used to make the SSH connection, and the source IP address.
8. To display the full event information in JSON format, choose **View event**. The **requestParameters** field contains the destination instance ID, OS user name, and public key that were used to make the SSH connection.

```
{  
    "eventVersion": "1.05",  
    "userIdentity": {  
        "type": "IAMUser",  
        "principalId": "ABCDEFGONGNOMOOCB6XYTQEXAMPLE",  
        "arn": "arn:aws:iam::1234567890120:user/IAM-friendly-name",  
        "accountId": "123456789012",  
        "accessKeyId": "ABCDEFGUZHNAW4OSN2AEXAMPLE",  
        "userName": "IAM-friendly-name",  
        "sessionContext": {  
            "attributes": {  
                "mfaAuthenticated": "false",  
                "creationDate": "2018-09-21T21:37:58Z"  
            }  
        },  
        "eventTime": "2018-09-21T21:38:00Z",  
        "eventSource": "ec2-instance-connect.amazonaws.com",  
        "eventName": "SendSSHPublicKey ",  
        "awsRegion": "us-west-2",  
        "sourceIPAddress": "123.456.789.012",  
        "userAgent": "aws-cli/1.15.61 Python/2.7.10 Darwin/16.7.0 botocore/1.10.60",  
        "requestParameters": {  
            "instanceId": "i-0123456789EXAMPLE",  
            "osUser": "ec2-user",  
            "SSHKey": {  
                "publicKey": "ssh-rsa ABCDEFGHIJKLMNOP001234567890EXAMPLE"  
            }  
        },  
        "responseElements": null,  
        "requestID": "1a2s3d4f-bde6-11e8-a892-f7ec64543add",  
        "eventID": "1a2w3d4r5-a88f-4e28-b3bf-30161f75be34",  
        "eventType": "AwsApiCall",  
        "recipientAccountId": "0987654321"  
    }  
}
```

If you have configured your AWS account to collect CloudTrail events in an S3 bucket, you can download and audit the information programmatically. For more information, see [Getting and viewing your CloudTrail log files](#) in the *AWS CloudTrail User Guide*.

Monitor your .NET and SQL Server applications with CloudWatch Application Insights

CloudWatch Application Insights helps you monitor your .NET and SQL Server applications that use Amazon EC2 instances along with other [AWS application resources](#). It identifies and sets up key metrics logs, and alarms across your application resources and technology stack (for example, your Microsoft SQL Server database, web (IIS) and application servers, OS, load balancers, and queues). It continuously monitors the metrics and logs to detect and correlate anomalies and errors. When errors and anomalies are detected, Application Insights generates [CloudWatch Events](#) that you can use to set up notifications or take actions. To aid with troubleshooting, it creates automated dashboards for the detected problems, which include correlated metric anomalies and log errors, along with additional insights to point you to the potential root cause. The automated dashboards help you to take swift remedial actions to keep your applications healthy and to prevent impact to the end users of your application.

To view a complete list of supported logs and metrics, see [Logs and Metrics Supported by Amazon CloudWatch Application Insights](#).

Information provided about detected problems:

- A short summary of the problem
- The start time and date of the problem
- The problem severity: High/Medium/Low
- The status of the detected problem: In-progress/Resolved
- Insights: Automatically generated insights on the detected problem and possible root cause
- Feedback on insights: Feedback you have provided about the usefulness of the insights generated by CloudWatch Application Insights for .NET and SQL Server
- Related observations: A detailed view of the metric anomalies and error snippets of relevant logs related to the problem across various application components

Feedback

You can provide feedback on automatically generated insights on detected problems by designating them useful or not useful. Your feedback on the insights, along with your application diagnostics (metric anomalies and log exceptions), are used to improve the future detection of similar problems.

For more information, see the [CloudWatch Application Insights](#) documentation in the *Amazon CloudWatch User Guide*.

Networking in Amazon EC2

Amazon VPC enables you to launch AWS resources, such as Amazon EC2 instances, into a virtual network dedicated to your AWS account, known as a virtual private cloud (VPC). When you launch an instance, you can select a subnet from the VPC. The instance is configured with a primary network interface, which is a logical virtual network card. The instance receives a primary private IP address from the IPv4 address of the subnet, and it is assigned to the primary network interface.

You can control whether the instance receives a public IP address from Amazon's pool of public IP addresses. The public IP address of an instance is associated with your instance only until it is stopped or terminated. If you require a persistent public IP address, you can allocate an Elastic IP address for your AWS account and associate it with an instance or a network interface. An Elastic IP address remains associated with your AWS account until you release it, and you can move it from one instance to another as needed. You can bring your own IP address range to your AWS account, where it appears as an address pool, and then allocate Elastic IP addresses from your address pool.

To increase network performance and reduce latency, you can launch instances in a placement group. You can get significantly higher packet per second (PPS) performance using enhanced networking. You can accelerate high performance computing and machine learning applications using an Elastic Fabric Adapter (EFA), which is a network device that you can attach to a supported instance type.

Features

- [Regions and Zones \(p. 1221\)](#)
- [Amazon EC2 instance IP addressing \(p. 1235\)](#)
- [Amazon EC2 instance hostname types \(p. 1250\)](#)
- [Bring your own IP addresses \(BYOIP\) in Amazon EC2 \(p. 1254\)](#)
- [Elastic IP addresses \(p. 1269\)](#)
- [Elastic network interfaces \(p. 1280\)](#)
- [Amazon EC2 instance network bandwidth \(p. 1324\)](#)
- [Enhanced networking on Windows \(p. 1326\)](#)
- [Placement groups \(p. 1352\)](#)
- [Network maximum transmission unit \(MTU\) for your EC2 instance \(p. 1368\)](#)
- [Virtual private clouds \(p. 1373\)](#)
- [Ports and Protocols for Windows Amazon Machine Images \(AMIs\) \(p. 1375\)](#)

Regions and Zones

Amazon EC2 is hosted in multiple locations world-wide. These locations are composed of AWS Regions, Availability Zones, Local Zones, AWS Outposts, and Wavelength Zones.

- Each Region is a separate geographic area.
- Availability Zones are multiple, isolated locations within each Region.
- Local Zones provide you the ability to place resources, such as compute and storage, in multiple locations closer to your end users.

- AWS Outposts brings native AWS services, infrastructure, and operating models to virtually any data center, co-location space, or on-premises facility.
- Wavelength Zones allow developers to build applications that deliver ultra-low latencies to 5G devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks.

AWS operates state-of-the-art, highly available data centers. Although rare, failures can occur that affect the availability of instances that are in the same location. If you host all of your instances in a single location that is affected by a failure, none of your instances would be available.

To help you determine which deployment is best for you, see [AWS Wavelength FAQs](#).

Contents

- [Regions \(p. 1222\)](#)
- [Availability Zones \(p. 1226\)](#)
- [Local Zones \(p. 1230\)](#)
- [Wavelength Zones \(p. 1232\)](#)
- [AWS Outposts \(p. 1234\)](#)

Regions

Each Region is designed to be isolated from the other Regions. This achieves the greatest possible fault tolerance and stability.

When you view your resources, you see only the resources that are tied to the Region that you specified. This is because Regions are isolated from each other, and we don't automatically replicate resources across Regions.

When you launch an instance, you must select an AMI that's in the same Region. If the AMI is in another Region, you can copy the AMI to the Region you're using. For more information, see [Copy an AMI \(p. 166\)](#).

Note that there is a charge for data transfer between Regions. For more information, see [Amazon EC2 Pricing - Data Transfer](#).

Contents

- [Available Regions \(p. 1222\)](#)
- [Regions and endpoints \(p. 1224\)](#)
- [Describe your Regions \(p. 1224\)](#)
- [Get the Region name \(p. 1225\)](#)
- [Specify the Region for a resource \(p. 1225\)](#)

Available Regions

Your account determines the Regions that are available to you.

- An AWS account provides multiple Regions so that you can launch Amazon EC2 instances in locations that meet your requirements. For example, you might want to launch instances in Europe to be closer to your European customers or to meet legal requirements.
- An AWS GovCloud (US-West) account provides access to the AWS GovCloud (US-West) Region and the AWS GovCloud (US-East) Region. For more information, see [AWS GovCloud \(US\)](#).

- An Amazon AWS (China) account provides access to the Beijing and Ningxia Regions only. For more information, see [Amazon Web Services in China](#).

The following table lists the Regions provided by an AWS account. You can't describe or access additional Regions from an AWS account, such as the AWS GovCloud (US) Regions or the China Regions. To use a Region introduced after March 20, 2019, you must enable the Region. For more information, see [Managing AWS Regions](#) in the *AWS General Reference*.

Code	Name	Opt-in Status
us-east-2	US East (Ohio)	Not required
us-east-1	US East (N. Virginia)	Not required
us-west-1	US West (N. California)	Not required
us-west-2	US West (Oregon)	Not required
af-south-1	Africa (Cape Town)	Required
ap-east-1	Asia Pacific (Hong Kong)	Required
ap-south-2	Asia Pacific (Hyderabad)	Required
ap-southeast-3	Asia Pacific (Jakarta)	Required
ap-southeast-4	Asia Pacific (Melbourne)	Required
ap-south-1	Asia Pacific (Mumbai)	Not required
ap-northeast-3	Asia Pacific (Osaka)	Not required
ap-northeast-2	Asia Pacific (Seoul)	Not required
ap-southeast-1	Asia Pacific (Singapore)	Not required
ap-southeast-2	Asia Pacific (Sydney)	Not required
ap-northeast-1	Asia Pacific (Tokyo)	Not required
ca-central-1	Canada (Central)	Not required
eu-central-1	Europe (Frankfurt)	Not required
eu-west-1	Europe (Ireland)	Not required
eu-west-2	Europe (London)	Not required
eu-south-1	Europe (Milan)	Required
eu-west-3	Europe (Paris)	Not required
eu-south-2	Europe (Spain)	Required
eu-north-1	Europe (Stockholm)	Not required
eu-central-2	Europe (Zurich)	Required
il-central-1	Israel (Tel Aviv)	Required
me-south-1	Middle East (Bahrain)	Required

Code	Name	Opt-in Status
me-central-1	Middle East (UAE)	Required
sa-east-1	South America (São Paulo)	Not required

For more information, see [AWS Global Infrastructure](#).

The number and mapping of Availability Zones per Region may vary between AWS accounts. To list the Availability Zones that are available to your account, you can use the Amazon EC2 console or the command line interface. For more information, see [Describe your Regions \(p. 1224\)](#).

Regions and endpoints

When you work with an instance using the command line interface or API actions, you must specify its Regional endpoint. For more information about the Regions and endpoints for Amazon EC2, see [Amazon EC2 endpoints and quotas](#) in the *Amazon Web Services General Reference*.

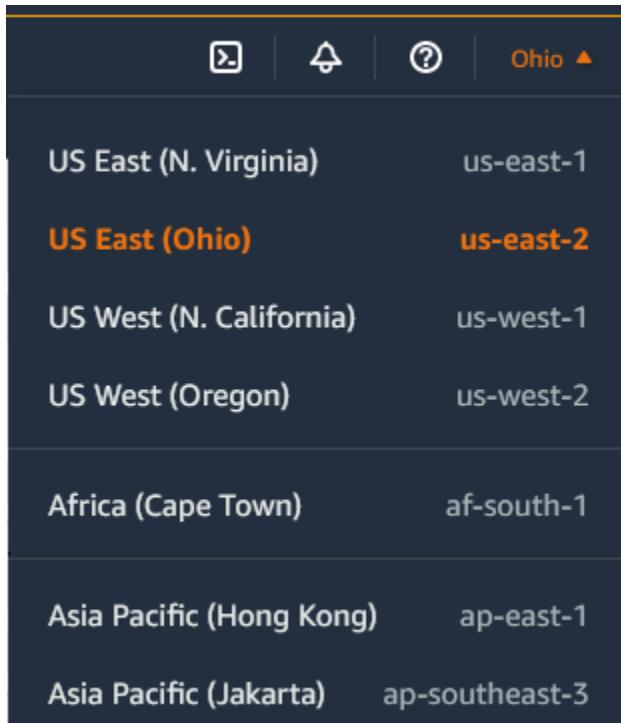

For more information about endpoints and protocols in AWS GovCloud (US-West), see [Service Endpoints](#) in the *AWS GovCloud (US) User Guide*.

Describe your Regions

You can use the Amazon EC2 console or the command line interface to determine which Regions are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

To find your Regions using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector.

3. Your EC2 resources for this Region are displayed on the **EC2 Dashboard** in the **Resources** section.

To find your Regions using the AWS CLI

Use the [describe-regions](#) command as follows to describe the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

To describe all Regions, including any Regions that are disabled for your account, add the `--all-regions` option as follows.

```
aws ec2 describe-regions --all-regions
```

Get the Region name

You can use the Amazon Lightsail API to view the name of a Region.

To view the Region name using the AWS CLI

Use the [get-regions](#) command as follows to describe the name of the specified Region.

```
aws lightsail get-regions --query "regions[?name=='region-name'].displayName" --output text
```

The following example returns the name of the us-east-2 Region.

```
aws lightsail get-regions --query "regions[?name=='us-east-2'].displayName" --output text
```

The following is the output:

```
Ohio
```

Specify the Region for a resource

Every time you create an Amazon EC2 resource, you can specify the Region for the resource. You can specify the Region for a resource using the AWS Management Console or the command line.

Considerations

Some AWS resources might not be available in all Regions. Ensure that you can create the resources that you need in the desired Regions before you launch an instance.

To specify the Region for a resource using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the Region.

		Ohio ▾
US East (N. Virginia)	us-east-1	
US East (Ohio)	us-east-2	
US West (N. California)	us-west-1	
US West (Oregon)	us-west-2	
Africa (Cape Town)	af-south-1	
Asia Pacific (Hong Kong)	ap-east-1	
Asia Pacific (Jakarta)	ap-southeast-3	

To specify the default Region using the command line

You can set the value of an environment variable to the desired Regional endpoint (for example, <https://ec2.us-east-2.amazonaws.com>):

- AWS_DEFAULT_REGION (AWS CLI)
- Set-AWSDefaultRegion (AWS Tools for Windows PowerShell)

Alternatively, you can use the `--region` (AWS CLI) or `-Region` (AWS Tools for Windows PowerShell) command line option with each individual command. For example, `--region us-east-2`.

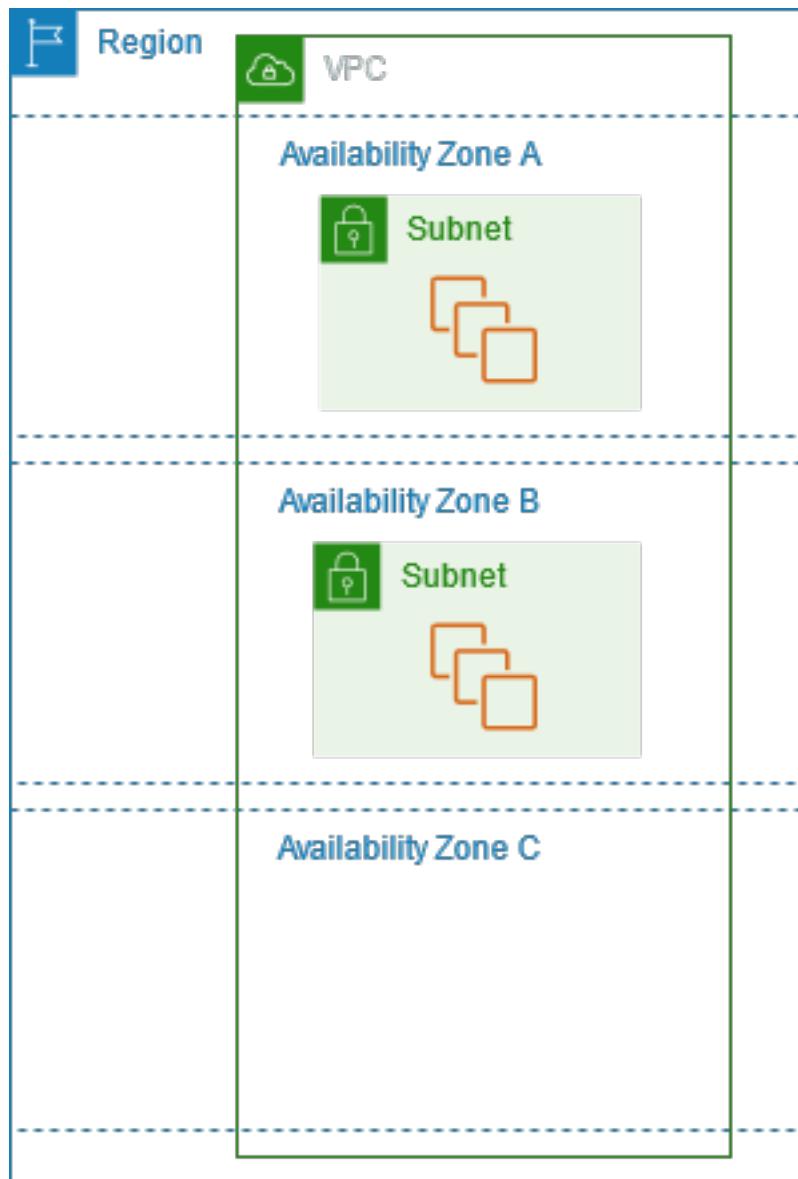

For more information about the endpoints for Amazon EC2, see [Service endpoints](#) in the *AWS General Reference*.

Availability Zones

Each Region has multiple, isolated locations known as *Availability Zones*. The code for Availability Zone is its Region code followed by a letter identifier. For example, `us-east-1a`.

When you launch an instance, you select a Region and a virtual private cloud (VPC), and then you can either select a subnet from one of the Availability Zones or let us choose one for you. If you distribute your instances across multiple Availability Zones and one instance fails, you can design your application so that an instance in another Availability Zone can handle requests. You can also use Elastic IP addresses to mask the failure of an instance in one Availability Zone by rapidly remapping the address to an instance in another Availability Zone.

The following diagram illustrates multiple Availability Zones in an AWS Region. Availability Zone A and Availability Zone B each have one subnet, and each subnet has instances. Availability Zone C has no subnets, therefore you can't launch instances into this Availability Zone.

As Availability Zones grow over time, our ability to expand them can become constrained. If this happens, we might restrict you from launching an instance in a constrained Availability Zone unless you already have an instance in that Availability Zone. Eventually, we might also remove the constrained Availability Zone from the list of Availability Zones for new accounts. Therefore, your account might have a different number of available Availability Zones in a Region than another account.

Contents

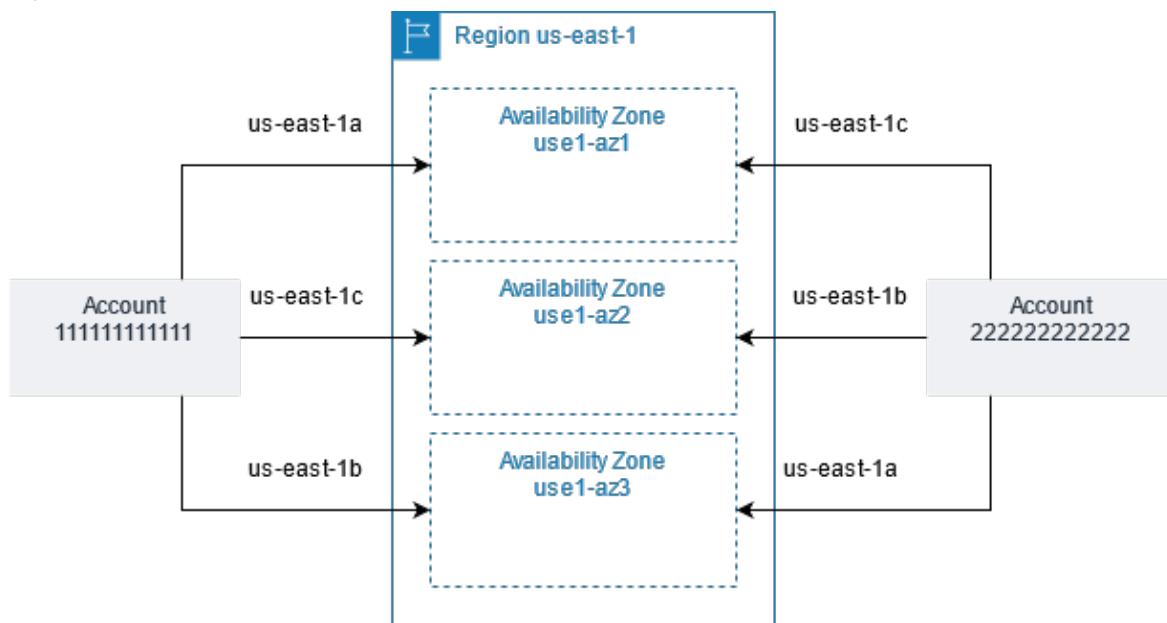

- [AZ IDs \(p. 1228\)](#)
- [Describe your Availability Zones \(p. 1228\)](#)
- [Launch instances in an Availability Zone \(p. 1229\)](#)
- [Migrate an instance to another Availability Zone \(p. 1229\)](#)

AZ IDs

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to codes for each AWS account. For example, the Availability Zone `us-east-1a` for your AWS account might not be the same physical location as `us-east-1a` for another AWS account.

To coordinate Availability Zones across accounts, you must use the *AZ ID*, which is a unique and consistent identifier for an Availability Zone. For example, `use1-az1` is an AZ ID for the `us-east-1` Region and it has the same physical location in every AWS account. You can view the AZ IDs for your account to determine the physical location of your resources relative to the resources in another account. For example, if you share a subnet in the Availability Zone with the AZ ID `use1-az2` with another account, this subnet is available to that account in the Availability Zone whose AZ ID is also `use1-az2`.

The following diagram illustrates two accounts with different mappings of Availability Zone code to AZ ID.

Describe your Availability Zones

You can use the Amazon EC2 console or the command line interface to determine which Availability Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

To find your Availability Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the Region.
3. On the navigation pane, choose **EC2 Dashboard**.
4. The Availability Zones are listed in the **Service health** pane.

To find your Availability Zones using the AWS CLI

- Use the [`describe-availability-zones`](#) command as follows to describe the Availability Zones within the specified Region that are enabled for your account.

```
aws ec2 describe-availability-zones --region region-name
```

- Use the [describe-availability-zones](#) command as follows to describe the Availability Zones regardless of the opt-in status.

```
aws ec2 describe-availability-zones --all-availability-zones
```

Launch instances in an Availability Zone

When you launch an instance, select a Region that puts your instances closer to specific customers, or meets the legal or other requirements that you have. By launching your instances in separate Availability Zones, you can protect your applications from the failure of a single location.

When you launch an instance, you can optionally specify an Availability Zone in the Region that you are using. If you do not specify an Availability Zone, we select an Availability Zone for you. When you launch your initial instances, we recommend that you accept the default Availability Zone, because this allows us to select the best Availability Zone for you based on system health and available capacity. If you launch additional instances, specify an Availability Zone only if your new instances must be close to, or separated from, your running instances.

Migrate an instance to another Availability Zone

If necessary, you can migrate an instance from one Availability Zone to another. For example, if you try to modify the instance type of your instance and we can't launch an instance of the new instance type in the current Availability Zone, you can migrate the instance to an Availability Zone with capacity for the new instance type.

The migration process involves:

- Creating an AMI from the original instance
- Launching an instance in the new Availability Zone
- Updating the configuration of the new instance, as shown in the following procedure

To migrate an instance to another Availability Zone

1. Create an AMI from the instance. The procedure depends on your operating system and the type of root device volume for the instance. For more information, see the documentation that corresponds to your operating system and root device volume:
 - [Create an Amazon EBS-backed Linux AMI](#)
 - [Create an instance store-backed Linux AMI](#)
 - [Create a custom Windows AMI](#)
2. If you need to preserve the private IPv4 address of the instance, you must delete the subnet in the current Availability Zone and then create a subnet in the new Availability Zone with the same IPv4 address range as the original subnet. Note that you must terminate all instances in a subnet before you can delete it. Therefore, you should create AMIs from all of the instances in your subnet so that you can move all instances from the current subnet to the new subnet.
3. Launch an instance from the AMI that you just created, specifying the new Availability Zone or subnet. You can use the same instance type as the original instance, or select a new instance type. For more information, see [Launch instances in an Availability Zone \(p. 1229\)](#).
4. If the original instance has an associated Elastic IP address, associate it with the new instance. For more information, see [Disassociate an Elastic IP address \(p. 1273\)](#).

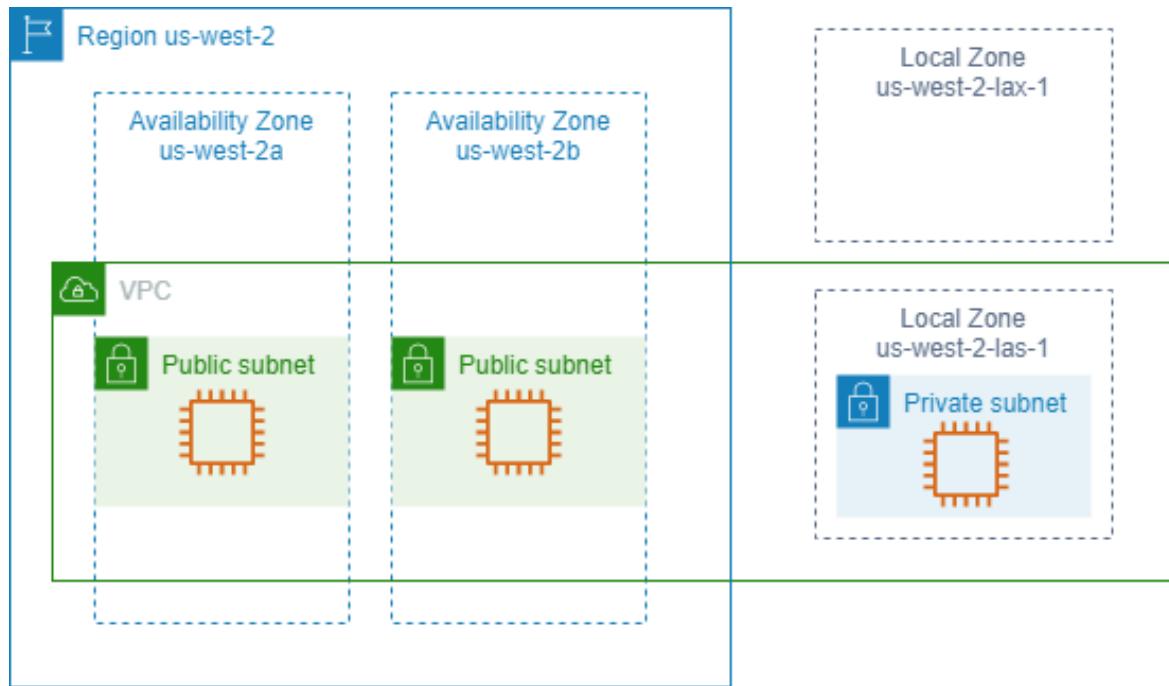

5. If the original instance is a Reserved Instance, change the Availability Zone for your reservation. (If you also changed the instance type, you can also change the instance type for your reservation.) For more information, see [Submit modification requests \(p. 385\)](#).
6. (Optional) Terminate the original instance. For more information, see [Terminate an instance \(p. 617\)](#).

Local Zones

A Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect, so that resources created in a Local Zone can serve local users with low-latency communications. For more information, see [AWS Local Zones](#).

The code for a Local Zone is its Region code followed by an identifier that indicates its physical location. For example, us-west-2-lax-1 in Los Angeles.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and two of its Local Zones. The VPC spans the Availability Zones and one of the Local Zones. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Local Zone, you must first enable it. For more information, see [the section called "Opt in to Local Zones" \(p. 1231\)](#). Next, create a subnet in the Local Zone. Finally, launch resources in the Local Zone subnet, such as instances, so that your applications are close to your users.

Contents

- [Available Local Zones \(p. 1231\)](#)
- [Opt in to Local Zones \(p. 1231\)](#)
- [Launch instances in a Local Zone \(p. 1231\)](#)

Available Local Zones

You can use the Amazon EC2 console or a command line interface to determine which Local Zones are available for your account. For a complete list, see [AWS Local Zones Locations](#).

To find your Local Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the parent Region.
3. On the navigation pane, choose **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account attributes, Zones**.

To find your Local Zones using the AWS CLI

Use the `describe-availability-zones` command as follows to describe all Local Zones in the specified Region, even if they are not enabled. To describe only the Local Zones that you've enabled, omit the `--all-availability-zones` option.

```
aws ec2 describe-availability-zones --region region-name --filters Name=zone-type,Values=local-zone --all-availability-zones
```

Opt in to Local Zones

Before you can specify a Local Zone for a resource or service, you must opt in to Local Zones.

Consideration

Some AWS resources might not be available in all Regions. Make sure that you can create the resources that you need in the desired Regions or Local Zones before launching an instance in a specific Local Zone. For a list of services supported in each Local Zone see [AWS Local Zones Features](#).

To opt in to Local Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the upper-left corner of the page, select **New EC2 Experience**. You cannot complete this task using the old console experience.
3. From the navigation bar, choose the **Regions** selector and then choose the parent Region.
4. On the navigation pane, choose **EC2 Dashboard**.
5. In the upper-right corner of the page, choose **Account attributes, Zones**.
6. For the Local Zone to enable, choose **Manage**.
7. For **Zone group**, choose **Enabled**.
8. Choose **Update zone group**.

To opt in to Local Zones using the AWS CLI

Use the `modify-availability-zone-group` command.

Launch instances in a Local Zone

When you launch an instance, you can specify a subnet that is in a Local Zone. You also allocate an IP address from a network border group. A network border group is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, us-west-2-lax-1a.

You can allocate the following IP addresses from a network border group:

- Amazon-provided Elastic IPv4 addresses
- Amazon-provided IPv6 VPC addresses (available only in the Los Angeles zones)

For more information about how to launch an instance in a Local Zone, see [Getting started with AWS Local Zones](#) in the *AWS Local Zones User Guide*.

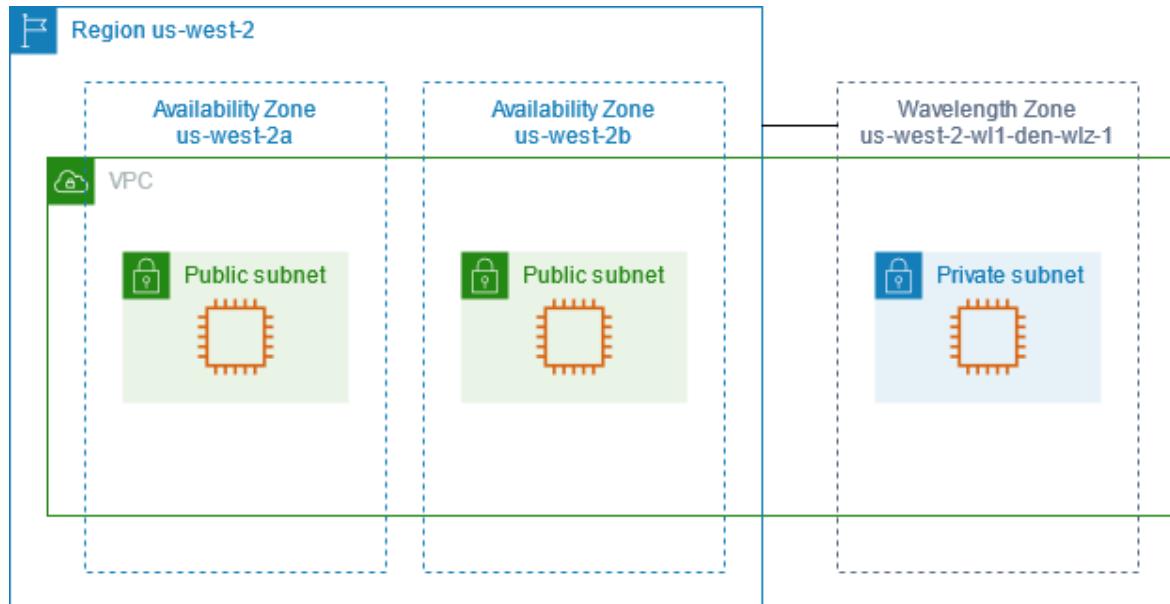

Wavelength Zones

AWS Wavelength enables developers to build applications that deliver ultra-low latencies to mobile devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks. Developers can extend a virtual private cloud (VPC) to one or more Wavelength Zones, and then use AWS resources like Amazon EC2 instances to run applications that require ultra-low latency and a connection to AWS services in the Region.

A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed. Wavelength Zones are tied to a Region. A Wavelength Zone is a logical extension of a Region, and is managed by the control plane in the Region.

The code for a Wavelength Zone is its Region code followed by an identifier that indicates the physical location. For example, us-east-1-wl1-bos-wlz-1 in Boston.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and a Wavelength Zone. The VPC spans the Availability Zones and the Wavelength Zone. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Wavelength Zone, you must first opt in to the Zone. For more information, see [the section called "Enable Wavelength Zones" \(p. 1233\)](#). Next, create a subnet in the Wavelength Zone. Finally, launch your resources in the Wavelength Zones subnet, so that your applications are closer to your end users.

Wavelength Zones are not available in every Region. For information about the Regions that support Wavelength Zones, see [Available Wavelength Zones](#) in the *AWS Wavelength Developer Guide*.

Contents

- [Describe your Wavelength Zones \(p. 1233\)](#)
- [Enable Wavelength Zones \(p. 1233\)](#)
- [Launch instances in a Wavelength Zone \(p. 1234\)](#)

Describe your Wavelength Zones

You can use the Amazon EC2 console or the command line interface to determine which Wavelength Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

To find your Wavelength Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, choose the **Regions** selector and then choose the Region.
3. On the navigation pane, choose **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account attributes, Zones**.

To find your Wavelength Zones using the AWS CLI

- Use the [describe-availability-zones](#) command as follows to describe the Wavelength Zones within the specified Region that are enabled for your account.

```
aws ec2 describe-availability-zones --region region-name
```

- Use the [describe-availability-zones](#) command as follows to describe the Wavelength Zones regardless of the opt-in status.

```
aws ec2 describe-availability-zones --all-availability-zones
```

Enable Wavelength Zones

Before you specify a Wavelength Zone for a resource or service, you must opt in to Wavelength Zones.

Considerations

- Some AWS resources are not available in all Regions. Make sure that you can create the resources that you need in the desired Region or Wavelength Zone before launching an instance in a specific Wavelength Zone.

To opt in to Wavelength Zone using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the upper-left corner of the page, select **New EC2 Experience**. You cannot complete this task using the old console experience.
3. From the navigation bar, choose the **Regions** selector and then choose the Region.
4. On the navigation pane, choose **EC2 Dashboard**.
5. In the upper-right corner of the page, choose **Account attributes, Zones**.
6. Under **Wavelength Zones**, choose **Manage** for the Wavelength Zone.
7. Choose **Enable**.

8. Choose **Update zone group**.

To enable Wavelength Zones using the AWS CLI

Use the [modify-availability-zone-group](#) command.

Launch instances in a Wavelength Zone

When you launch an instance, you can specify a subnet which is in a Wavelength Zone. You also allocate a carrier IP address from a network border group, which is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, us-east-1-wl1-bos-wlz-1.

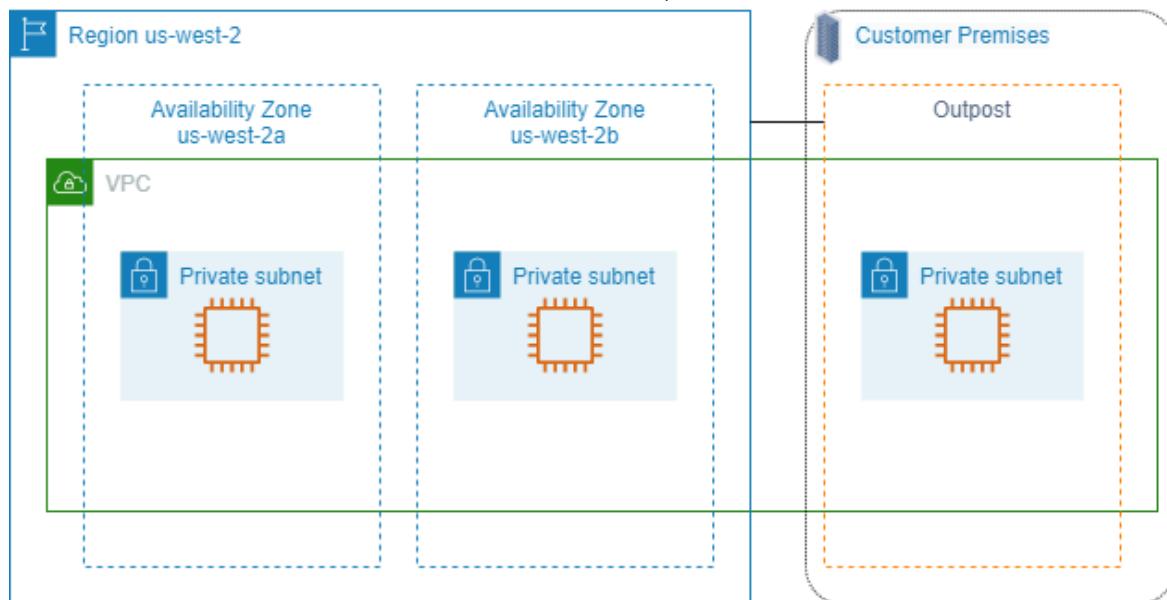

For information about how to launch an instance in a Wavelength Zone, see [Get started with AWS Wavelength](#) in the *AWS Wavelength Developer Guide*.

AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region. You can create subnets on your Outpost and specify them when you create AWS resources. Instances in Outpost subnets communicate with other instances in the AWS Region using private IP addresses, all within the same VPC.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and an Outpost. The VPC spans the Availability Zones and the Outpost. The Outpost is in an on-premises customer data center. Each zone in the VPC has one subnet, and each subnet has an instance.

To begin using AWS Outposts, you must create an Outpost and order Outpost capacity. For more information about Outposts configurations, see [our catalog](#). After your Outpost equipment is installed,

the compute and storage capacity is available for you when you launch Amazon EC2 instances on your Outpost.

Launch instances on an Outpost

You can launch EC2 instances in the Outpost subnet that you created. Security groups control inbound and outbound traffic for instances with elastic network interfaces in an Outpost subnet, as they do for instances in an Availability Zone subnet. To connect to an EC2 instance in an Outpost subnet, you can specify a key pair when you launch the instance, as you do for instances in an Availability Zone subnet.

The root volume for an instance on an Outpost rack must be 30 GB or smaller. You can specify data volumes in the block device mapping of the AMI or the instance to provide additional storage. To trim unused blocks from the boot volume, see [How to Build Sparse EBS Volumes](#) in the AWS Partner Network Blog.

We recommend that you increase the NVMe timeout for the root volume. For more information, see [I/O operation timeout \(p. 1941\)](#).

For information about how to create an Outpost, see [Get started with AWS Outposts](#) in the *AWS Outposts User Guide*.

Create a volume on an Outpost rack

AWS Outposts offers rack and server form factors. If your capacity is on an Outpost rack, you can create EBS volumes in the Outpost subnet that you created. When you create the volume, specify the Amazon Resource Name (ARN) of the Outpost.

The following [create-volume](#) command creates an empty 50 GB volume on the specified Outpost.

```
aws ec2 create-volume --availability-zone us-east-2a --outpost-arn arn:aws:outposts:us-east-2:123456789012:outpost/op-03e6fecad652a6138 --size 50
```

You can dynamically modify the size of your Amazon EBS gp2 volumes without detaching them. For more information about modifying a volume without detaching it, see [Request modifications to your EBS volumes \(p. 1911\)](#).

Amazon EC2 instance IP addressing

Amazon EC2 and Amazon VPC support both the IPv4 and IPv6 addressing protocols. By default, Amazon VPC uses the IPv4 addressing protocol; you can't disable this behavior. When you create a VPC, you must specify an IPv4 CIDR block (a range of private IPv4 addresses). You can optionally assign an IPv6 CIDR block to your VPC and assign IPv6 addresses from that block to instances in your subnets.

Contents

- [Private IPv4 addresses \(p. 1236\)](#)
- [Public IPv4 addresses \(p. 1236\)](#)
- [Elastic IP addresses \(IPv4\) \(p. 1237\)](#)
- [IPv6 addresses \(p. 1237\)](#)
- [Work with the IPv4 addresses for your instances \(p. 1238\)](#)
- [Work with the IPv6 addresses for your instances \(p. 1240\)](#)
- [Multiple IP addresses \(p. 1242\)](#)
- [EC2 instance hostnames \(p. 1250\)](#)

Private IPv4 addresses

A private IPv4 address is an IP address that's not reachable over the Internet. You can use private IPv4 addresses for communication between instances in the same VPC. For more information about the standards and specifications of private IPv4 addresses, see [RFC 1918](#). We allocate private IPv4 addresses to instances using DHCP.

Note

You can create a VPC with a publicly routable CIDR block that falls outside of the private IPv4 address ranges specified in RFC 1918. However, for the purposes of this documentation, we refer to private IPv4 addresses (or 'private IP addresses') as the IP addresses that are within the IPv4 CIDR range of your VPC.

VPC subnets can be one of the following types:

- IPv4-only subnets: You can only create resources in these subnets with IPv4 addresses assigned to them.
- IPv6-only subnets: You can only create resources in these subnets with IPv6 addresses assigned to them.
- IPv4 and IPv6 subnets: You can create resources in these subnets with either IPv4 or IPv6 addresses assigned to them.

When you launch an EC2 instance into an IPv4-only or dual stack (IPv4 and IPv6) subnet, the instance receives a primary private IP address from the IPv4 address range of the subnet. For more information, see [IP addressing](#) in the *Amazon VPC User Guide*. If you don't specify a primary private IP address when you launch the instance, we select an available IP address in the subnet's IPv4 range for you. Each instance has a default network interface (eth0) that is assigned the primary private IPv4 address. You can also specify additional private IPv4 addresses, known as *secondary private IPv4 addresses*. Unlike primary private IP addresses, secondary private IP addresses can be reassigned from one instance to another. For more information, see [Multiple IP addresses \(p. 1242\)](#).

A private IPv4 address, regardless of whether it is a primary or secondary address, remains associated with the network interface when the instance is stopped and started, or hibernated and started, and is released when the instance is terminated.

Public IPv4 addresses

A public IP address is an IPv4 address that's reachable from the Internet. You can use public addresses for communication between your instances and the Internet.

When you launch an instance in a default VPC, we assign it a public IP address by default. When you launch an instance into a nondefault VPC, the subnet has an attribute that determines whether instances launched into that subnet receive a public IP address from the public IPv4 address pool. By default, we don't assign a public IP address to instances launched in a nondefault subnet.

You can control whether your instance receives a public IP address as follows:

- Modifying the public IP addressing attribute of your subnet. For more information, see [Modify the public IPv4 addressing attribute for your subnet](#) in the *Amazon VPC User Guide*.
- Enabling or disabling the public IP addressing feature during launch, which overrides the subnet's public IP addressing attribute. For more information, see [Assign a public IPv4 address during instance launch \(p. 1239\)](#).

A public IP address is assigned to your instance from Amazon's pool of public IPv4 addresses, and is not associated with your AWS account. When a public IP address is disassociated from your instance, it is released back into the public IPv4 address pool, and you cannot reuse it.

You cannot manually associate or disassociate a public IP (IPv4) address from your instance. Instead, in certain cases, we release the public IP address from your instance, or assign it a new one:

- We release your instance's public IP address when it is stopped, hibernated, or terminated. Your stopped or hibernated instance receives a new public IP address when it is started.
- We release your instance's public IP address when you associate an Elastic IP address with it. When you disassociate the Elastic IP address from your instance, it receives a new public IP address.
- If the public IP address of your instance in a VPC has been released, it will not receive a new one if there is more than one network interface attached to your instance.
- If your instance's public IP address is released while it has a secondary private IP address that is associated with an Elastic IP address, the instance does not receive a new public IP address.

If you require a persistent public IP address that can be associated to and from instances as you require, use an Elastic IP address instead.

If you use dynamic DNS to map an existing DNS name to a new instance's public IP address, it might take up to 24 hours for the IP address to propagate through the Internet. As a result, new instances might not receive traffic while terminated instances continue to receive requests. To solve this problem, use an Elastic IP address. You can allocate your own Elastic IP address, and associate it with your instance. For more information, see [Elastic IP addresses \(p. 1269\)](#).

Note

Instances that access other instances through their public NAT IP address are charged for regional or Internet data transfer, depending on whether the instances are in the same Region.

Elastic IP addresses (IPv4)

An Elastic IP address is a public IPv4 address that you can allocate to your account. You can associate it to and disassociate it from instances as you require. It's allocated to your account until you choose to release it. For more information about Elastic IP addresses and how to use them, see [Elastic IP addresses \(p. 1269\)](#).

We do not support Elastic IP addresses for IPv6.

IPv6 addresses

You can optionally associate an IPv6 CIDR block with your VPC and associate IPv6 CIDR blocks with your subnets. The IPv6 CIDR block for your VPC is automatically assigned from Amazon's pool of IPv6 addresses; you cannot choose the range yourself. For more information, see the following topics in the *Amazon VPC User Guide*:

- [IP addressing for your VPCs and subnets](#)
- [Add an IPv6 CIDR block to your VPC](#)
- [Add an IPv6 CIDR block to your subnet](#)

IPv6 addresses are globally unique and can be configured to remain private or reachable over the Internet. Your instance receives an IPv6 address if an IPv6 CIDR block is associated with your VPC and subnet, and if one of the following is true:

- Your subnet is configured to automatically assign an IPv6 address to an instance during launch. For more information, see [Modify the IPv6 addressing attribute for your subnet](#).
- You assign an IPv6 address to your instance during launch.
- You assign an IPv6 address to the primary network interface of your instance after launch.

- You assign an IPv6 address to a network interface in the same subnet, and attach the network interface to your instance after launch.

When your instance receives an IPv6 address during launch, the address is associated with the primary network interface (eth0) of the instance. You can disassociate the IPv6 address from the network interface.

An IPv6 address persists when you stop and start, or hibernate and start, your instance, and is released when you terminate your instance. You cannot reassign an IPv6 address while it's assigned to another network interface—you must first unassign it.

You can assign additional IPv6 addresses to your instance by assigning them to a network interface attached to your instance. The number of IPv6 addresses you can assign to a network interface and the number of network interfaces you can attach to an instance varies per instance type. For more information, see [IP addresses per network interface per instance type \(p. 1282\)](#).

Work with the IPv4 addresses for your instances

You can assign a public IPv4 address to your instance when you launch it. You can view the IPv4 addresses for your instance in the console through either the **Instances** page or the **Network Interfaces** page.

Contents

- [View the IPv4 addresses \(p. 1238\)](#)
- [Assign a public IPv4 address during instance launch \(p. 1239\)](#)

View the IPv4 addresses

You can use the Amazon EC2 console to view the public and private IPv4 addresses of your instances. You can also determine the public IPv4 and private IPv4 addresses of your instance from within your instance by using instance metadata. For more information, see [Instance metadata and user data \(p. 862\)](#).

The public IPv4 address is displayed as a property of the network interface in the console, but it's mapped to the primary private IPv4 address through NAT. Therefore, if you inspect the properties of your network interface on your instance, for example, through `ifconfig` (Linux) or `ipconfig` (Windows), the public IPv4 address is not displayed. To determine your instance's public IPv4 address from an instance, use instance metadata.

To view the IPv4 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select your instance.
3. The following information is available on the **Networking** tab:
 - **Public IPv4 address** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.
 - **Private IPv4 addresses** — The private IPv4 address.
 - **Secondary private IPv4 addresses** — Any secondary private IPv4 addresses.
4. Alternatively, under **Network interfaces** on the **Networking** tab, choose the interface ID for the primary network interface (for example, eni-123abc456def78901). The following information is available:
 - **Private IPv4 address** — The primary private IPv4 address.

- **Public IPv4 address** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.
- **Secondary private IPv4 addresses** — Any secondary private IPv4 addresses.

To view the IPv4 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

To determine your instance's IPv4 addresses using instance metadata

1. Connect to your instance. For more information, see [Connect to your Windows instance \(p. 626\)](#).
2. Use the following command to access the private IP address:

```
PS C:\> Invoke-RestMethod http://169.254.169.254/latest/meta-data/local-ipv4
```

3. Use the following command to access the public IP address:

```
PS C:\> Invoke-RestMethod http://169.254.169.254/latest/meta-data/public-ipv4
```

If an Elastic IP address is associated with the instance, the value returned is that of the Elastic IP address.

Assign a public IPv4 address during instance launch

Each subnet has an attribute that determines whether instances launched into that subnet are assigned a public IP address. By default, nondefault subnets have this attribute set to false, and default subnets have this attribute set to true. When you launch an instance, a public IPv4 addressing feature is also available for you to control whether your instance is assigned a public IPv4 address; you can override the default behavior of the subnet's IP addressing attribute. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses, and is assigned to the network interface with the device index of eth0. This feature depends on certain conditions at the time you launch your instance.

Considerations

- You can't manually disassociate the public IP address from your instance after launch. Instead, it's automatically released in certain cases, after which you cannot reuse it. For more information, see [Public IPv4 addresses \(p. 1236\)](#). If you require a persistent public IP address that you can associate or disassociate at will, assign an Elastic IP address to the instance after launch instead. For more information, see [Elastic IP addresses \(p. 1269\)](#).
- You cannot auto-assign a public IP address if you specify more than one network interface. Additionally, you cannot override the subnet setting using the auto-assign public IP feature if you specify an existing network interface for eth0.
- The public IP addressing feature is only available during launch. However, whether you assign a public IP address to your instance during launch or not, you can associate an Elastic IP address with your instance after it's launched. For more information, see [Elastic IP addresses \(p. 1269\)](#). You can also modify your subnet's public IPv4 addressing behavior. For more information, see [Modify the public IPv4 addressing attribute for your subnet](#).

To assign a public IPv4 address during instance launch using the console

Follow the procedure to [launch an instance \(p. 554\)](#), and when you configure [Network Settings \(p. 556\)](#), choose the option to **Auto-assign Public IP**.

To enable or disable the public IP addressing feature using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- Use the `--associate-public-ip-address` or the `--no-associate-public-ip-address` option with the [run-instances](#) command (AWS CLI)
- Use the `-AssociatePublicIp` parameter with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell)

Work with the IPv6 addresses for your instances

You can view the IPv6 addresses assigned to your instance, assign a public IPv6 address to your instance, or unassign an IPv6 address from your instance. You can view these addresses in the console through either the **Instances** page or the **Network Interfaces** page.

Contents

- [View the IPv6 addresses \(p. 1240\)](#)
- [Assign an IPv6 address to an instance \(p. 1241\)](#)
- [Unassign an IPv6 address from an instance \(p. 1241\)](#)

View the IPv6 addresses

You can use the Amazon EC2 console, AWS CLI, and instance metadata to view the IPv6 addresses for your instances.

To view the IPv6 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Networking** tab, locate **IPv6 addresses**.
5. Alternatively, under **Network interfaces** on the **Networking** tab, choose the interface ID for the network interface (for example, eni-123abc456def78901). Locate **IPv6 addresses**.

To view the IPv6 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

To view the IPv6 addresses for an instance using instance metadata

1. Connect to your instance. For more information, see [Connect to your Windows instance \(p. 626\)](#).
2. Use the following command to view the IPv6 address (you can get the MAC address from <http://169.254.169.254/latest/meta-data/network/interfaces/macs/>).

```
PS C:\> Invoke-RestMethod http://169.254.169.254/latest/meta-data/network/interfaces/  
macs/mac-address/ipv6s
```

Assign an IPv6 address to an instance

If your VPC and subnet have IPv6 CIDR blocks associated with them, you can assign an IPv6 address to your instance during or after launch. The IPv6 address is assigned from the IPv6 address range of the subnet, and is assigned to the network interface with the device index of eth0.

To assign an IPv6 address during instance launch

Follow the procedure to [launch an instance \(p. 554\)](#), and when you configure [Network Settings \(p. 556\)](#), choose the option to **Auto-assign IPv6 IP**.

To assign an IPv6 address after launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Assign new IP address**. Enter an IPv6 address from the range of the subnet or leave the field blank to let Amazon choose an IPv6 address for you.
5. Choose **Save**.

To assign an IPv6 address using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- Use the `--ipv6-addresses` option with the [run-instances](#) command (AWS CLI)
- Use the `Ipv6Addresses` property for `-NetworkInterface` in the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell)
- [assign-ipv6-addresses](#) (AWS CLI)
- [Register-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell)

Unassign an IPv6 address from an instance

You can unassign an IPv6 address from an instance at any time.

To unassign an IPv6 address from an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Unassign** next to the IPv6 address.
5. Choose **Save**.

To unassign an IPv6 address from an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [unassign-ipv6-addresses](#) (AWS CLI)
- [Unregister-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell).

Multiple IP addresses

You can specify multiple private IPv4 and IPv6 addresses for your instances. The number of network interfaces and private IPv4 and IPv6 addresses that you can specify for an instance depends on the instance type. For more information, see [IP addresses per network interface per instance type \(p. 1282\)](#).

It can be useful to assign multiple IP addresses to an instance in your VPC to do the following:

- Host multiple websites on a single server by using multiple SSL certificates on a single server and associating each certificate with a specific IP address.
- Operate network appliances, such as firewalls or load balancers, that have multiple IP addresses for each network interface.
- Redirect internal traffic to a standby instance in case your instance fails, by reassigning the secondary IP address to the standby instance.

Contents

- [How multiple IP addresses work \(p. 1242\)](#)
- [Work with multiple IPv4 addresses \(p. 1243\)](#)
- [Work with multiple IPv6 addresses \(p. 1246\)](#)

How multiple IP addresses work

The following list explains how multiple IP addresses work with network interfaces:

- You can assign a secondary private IPv4 address to any network interface.
- You can assign multiple IPv6 addresses to a network interface that's in a subnet that has an associated IPv6 CIDR block.
- You must choose a secondary IPv4 address from the IPv4 CIDR block range of the subnet for the network interface.
- You must choose IPv6 addresses from the IPv6 CIDR block range of the subnet for the network interface.
- You associate security groups with network interfaces, not individual IP addresses. Therefore, each IP address you specify in a network interface is subject to the security group of its network interface.
- Multiple IP addresses can be assigned and unassigned to network interfaces attached to running or stopped instances.
- Secondary private IPv4 addresses that are assigned to a network interface can be reassigned to another one if you explicitly allow it.
- An IPv6 address cannot be reassigned to another network interface; you must first unassign the IPv6 address from the existing network interface.
- When assigning multiple IP addresses to a network interface using the command line tools or API, the entire operation fails if one of the IP addresses can't be assigned.
- Primary private IPv4 addresses, secondary private IPv4 addresses, Elastic IP addresses, and IPv6 addresses remain with a secondary network interface when it is detached from an instance or attached to an instance.
- Although you can't detach the primary network interface from an instance, you can reassign the secondary private IPv4 address of the primary network interface to another network interface.

The following list explains how multiple IP addresses work with Elastic IP addresses (IPv4 only):

- Each private IPv4 address can be associated with a single Elastic IP address, and vice versa.
- When a secondary private IPv4 address is reassigned to another interface, the secondary private IPv4 address retains its association with an Elastic IP address.
- When a secondary private IPv4 address is unassigned from an interface, an associated Elastic IP address is automatically disassociated from the secondary private IPv4 address.

Work with multiple IPv4 addresses

You can assign a secondary private IPv4 address to an instance, associate an Elastic IPv4 address with a secondary private IPv4 address, and unassign a secondary private IPv4 address.

Tasks

- [Assign a secondary private IPv4 address \(p. 1243\)](#)
- [Configure the operating system on your instance to recognize secondary private IPv4 addresses \(p. 1245\)](#)
- [Associate an Elastic IP address with the secondary private IPv4 address \(p. 1245\)](#)
- [View your secondary private IPv4 addresses \(p. 1245\)](#)
- [Unassign a secondary private IPv4 address \(p. 1246\)](#)

Assign a secondary private IPv4 address

You can assign the secondary private IPv4 address to the network interface for an instance as you launch the instance, or after the instance is running. This section includes the following procedures.

- [To assign a secondary private IPv4 address when launching an instance \(p. 1243\)](#)
- [To assign a secondary IPv4 address during launch using the command line \(p. 1244\)](#)
- [To assign a secondary private IPv4 address to a network interface \(p. 1244\)](#)
- [To assign a secondary private IPv4 to an existing instance using the command line \(p. 1245\)](#)

New console

To assign a secondary private IPv4 address when launching an instance

1. Follow the procedure to [launch an instance \(p. 554\)](#), and when you configure [Network Settings \(p. 556\)](#), choose **Advanced network configuration**.
2. Under **Secondary IP**, choose **Automatically assign** to have Amazon automatically assign a secondary IPv4 address or choose **Manually assign** to manually enter a CIDR.
3. Complete the remaining steps to [launch the instance \(p. 554\)](#).

Old console

To assign a secondary private IPv4 address when launching an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. Select an AMI, then choose an instance type and choose **Next: Configure Instance Details**.
4. On the **Configure Instance Details** page, for **Network**, select a VPC and for **Subnet**, select a subnet.

5. In the **Network Interfaces** section, do the following, and then choose **Next: Add Storage**:
 - To add another network interface, choose **Add Device**. The console enables you to specify up to two network interfaces when you launch an instance. After you launch the instance, choose **Network Interfaces** in the navigation pane to add additional network interfaces. The total number of network interfaces that you can attach varies by instance type. For more information, see [IP addresses per network interface per instance type \(p. 1282\)](#).
- Important**

When you add a second network interface, the system can no longer auto-assign a public IPv4 address. You will not be able to connect to the instance over IPv4 unless you assign an Elastic IP address to the primary network interface (eth0). You can assign the Elastic IP address after you complete the Launch wizard. For more information, see [Work with Elastic IP addresses \(p. 1270\)](#).

 - For each network interface, under **Secondary IP addresses**, choose **Add IP**, and then enter a private IP address from the subnet range, or accept the default Auto-assign value to let Amazon select an address.
6. On the next **Add Storage** page, you can specify volumes to attach to the instance besides the volumes specified by the AMI (such as the root device volume), and then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify tags for the instance, such as a user-friendly name, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, select an existing security group or create a new one. Choose **Review and Launch**.
9. On the **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance. If you're new to Amazon EC2 and haven't created any key pairs, the wizard prompts you to create one.

Important

After you have added a secondary private IP address to a network interface, you must connect to the instance and configure the secondary private IP address on the instance itself. For more information, see [Configure the operating system on your instance to recognize secondary private IPv4 addresses \(p. 1245\)](#).

To assign a secondary IPv4 address during launch using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).
 - The --secondary-private-ip-addresses option with the [run-instances](#) command (AWS CLI)
 - Define -NetworkInterface and specify the PrivateIpAddresses parameter with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).

To assign a secondary private IPv4 address to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**, and then select the network interface attached to the instance.
3. Choose **Actions, Manage IP Addresses**.
4. Under **IPv4 Addresses**, choose **Assign new IP**.
5. Enter a specific IPv4 address that's within the subnet range for the instance, or leave the field blank to let Amazon select an IP address for you.
6. (Optional) Choose **Allow reassignment** to allow the secondary private IP address to be reassigned if it is already assigned to another network interface.

7. Choose **Yes, Update**.

Alternatively, you can assign a secondary private IPv4 address to an instance. Choose **Instances** in the navigation pane, select the instance, and then choose **Actions, Networking, Manage IP addresses**. You can configure the same information as you did in the steps above. The IP address is assigned to the primary network interface (eth0) for the instance.

To assign a secondary private IPv4 to an existing instance using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).
 - [assign-private-ip-addresses](#) (AWS CLI)
 - [Register-EC2PrivateIpAddress](#) (AWS Tools for Windows PowerShell)

Configure the operating system on your instance to recognize secondary private IPv4 addresses

After you assign a secondary private IPv4 address to your instance, you need to configure the operating system on your instance to recognize the secondary private IP address.

For information about configuring a Windows instance, see [Configure a secondary private IPv4 address for your Windows instance \(p. 849\)](#).

Associate an Elastic IP address with the secondary private IPv4 address

To associate an Elastic IP address with a secondary private IPv4 address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Choose **Actions**, and then select **Associate address**.
4. For **Network interface**, select the network interface, and then select the secondary IP address from the **Private IP** list.
5. Choose **Associate**.

To associate an Elastic IP address with a secondary private IPv4 address using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).
 - [associate-address](#) (AWS CLI)
 - [Register-EC2Address](#) (AWS Tools for Windows PowerShell)

View your secondary private IPv4 addresses

To view the private IPv4 addresses assigned to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface with private IP addresses to view.

4. On the **Details** tab in the details pane, check the **Primary private IPv4 IP** and **Secondary private IPv4 IPs** fields for the primary private IPv4 address and any secondary private IPv4 addresses assigned to the network interface.

To view the private IPv4 addresses assigned to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance with private IPv4 addresses to view.
4. On the **Description** tab in the details pane, check the **Private IPs** and **Secondary private IPs** fields for the primary private IPv4 address and any secondary private IPv4 addresses assigned to the instance through its network interface.

Unassign a secondary private IPv4 address

If you no longer require a secondary private IPv4 address, you can unassign it from the instance or the network interface. When a secondary private IPv4 address is unassigned from a network interface, the Elastic IP address (if it exists) is also disassociated.

To unassign a secondary private IPv4 address from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select an instance, choose **Actions, Networking, Manage IP addresses**.
4. Under **IPv4 Addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Yes, Update**.

To unassign a secondary private IPv4 address from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface, choose **Actions, Manage IP Addresses**.
4. Under **IPv4 Addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Yes, Update**.

To unassign a secondary private IPv4 address using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).
 - [unassign-private-ip-addresses](#) (AWS CLI)
 - [Unregister-EC2PrivateIpAddress](#) (AWS Tools for Windows PowerShell)

Work with multiple IPv6 addresses

You can assign multiple IPv6 addresses to your instance, view the IPv6 addresses assigned to your instance, and unassign IPv6 addresses from your instance.

Contents

- [Assign multiple IPv6 addresses \(p. 1247\)](#)
- [View your IPv6 addresses \(p. 1248\)](#)
- [Unassign an IPv6 address \(p. 1249\)](#)

Assign multiple IPv6 addresses

You can assign one or more IPv6 addresses to your instance during launch or after launch. To assign an IPv6 address to an instance, the VPC and subnet in which you launch the instance must have an associated IPv6 CIDR block.

New console

To assign multiple IPv6 addresses during launch

1. Follow the procedure to [launch an instance \(p. 554\)](#), and when you configure [Network Settings \(p. 556\)](#), choose **Advanced network configuration**.
2. To assign a secondary IPv6 address, under **IPv6 IPs**, choose **Automatically assign** to have Amazon automatically assign a secondary IPv6 address or choose **Manually assign** to manually enter a CIDR.
3. Complete the remaining steps to [launch the instance \(p. 554\)](#).

Old console

To assign multiple IPv6 addresses during launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the dashboard, choose **Launch Instance**.
3. Select an AMI, choose an instance type, and choose **Next: Configure Instance Details**. Ensure that you choose an instance type that supports IPv6. For more information, see [Instance types \(p. 210\)](#).
4. On the **Configure Instance Details** page, select a VPC from the **Network** list, and a subnet from the **Subnet** list.
5. In the **Network Interfaces** section, do the following, and then choose **Next: Add Storage**:
 - To assign a single IPv6 address to the primary network interface (eth0), under **IPv6 IPs**, choose **Add IP**. To add a secondary IPv6 address, choose **Add IP** again. You can enter an IPv6 address from the range of the subnet, or leave the default **Auto-assign** value to let Amazon choose an IPv6 address from the subnet for you.
 - Choose **Add Device** to add another network interface and repeat the steps above to add one or more IPv6 addresses to the network interface. The console enables you to specify up to two network interfaces when you launch an instance. After you launch the instance, choose **Network Interfaces** in the navigation pane to add additional network interfaces. The total number of network interfaces that you can attach varies by instance type. For more information, see [IP addresses per network interface per instance type \(p. 1282\)](#).
6. Follow the next steps in the wizard to attach volumes and tag your instance.
7. On the **Configure Security Group** page, select an existing security group or create a new one. If you want your instance to be reachable over IPv6, ensure that your security group has rules that allow access from IPv6 addresses. For more information, see [Security group rules for different use cases \(p. 1687\)](#). Choose **Review and Launch**.
8. On the **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance. If you're new to Amazon EC2 and haven't created any key pairs, the wizard prompts you to create one.

You can use the **Instances** screen Amazon EC2 console to assign multiple IPv6 addresses to an existing instance. This assigns the IPv6 addresses to the primary network interface (eth0) for the instance. To assign a specific IPv6 address to the instance, ensure that the IPv6 address is not already assigned to another instance or network interface.

To assign multiple IPv6 addresses to an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, choose **Actions, Networking, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Assign new IP** for each IPv6 address you want to add. You can specify an IPv6 address from the range of the subnet, or leave the **Auto-assign** value to let Amazon choose an IPv6 address for you.
5. Choose **Yes, Update**.

Alternatively, you can assign multiple IPv6 addresses to an existing network interface. The network interface must have been created in a subnet that has an associated IPv6 CIDR block. To assign a specific IPv6 address to the network interface, ensure that the IPv6 address is not already assigned to another network interface.

To assign multiple IPv6 addresses to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface, choose **Actions, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Assign new IP** for each IPv6 address you want to add. You can specify an IPv6 address from the range of the subnet, or leave the **Auto-assign** value to let Amazon choose an IPv6 address for you.
5. Choose **Yes, Update**.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- **Assign an IPv6 address during launch:**
 - Use the `--ipv6-addresses` or `--ipv6-address-count` options with the [run-instances](#) command (AWS CLI)
 - Define `-NetworkInterface` and specify the `Ipv6Addresses` or `Ipv6AddressCount` parameters with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).
- **Assign an IPv6 address to a network interface:**
 - [assign-ipv6-addresses](#) (AWS CLI)
 - [Register-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell)

View your IPv6 addresses

You can view the IPv6 addresses for an instance or for a network interface.

To view the IPv6 addresses assigned to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Select your instance. In the details pane, review the **IPv6 IPs** field.

To view the IPv6 addresses assigned to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface. In the details pane, review the **IPv6 IPs** field.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- **View the IPv6 addresses for an instance:**
 - [describe-instances](#) (AWS CLI)
 - [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).
- **View the IPv6 addresses for a network interface:**
 - [describe-network-interfaces](#) (AWS CLI)
 - [Get-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Unassign an IPv6 address

You can unassign an IPv6 address from the primary network interface of an instance, or you can unassign an IPv6 address from a network interface.

To unassign an IPv6 address from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, choose **Actions, Networking, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Unassign** for the IPv6 address to unassign.
5. Choose **Yes, Update**.

To unassign an IPv6 address from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface, choose **Actions, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Unassign** for the IPv6 address to unassign.
5. Choose **Save**.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [unassign-ipv6-addresses](#) (AWS CLI)
- [Unregister-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell).

EC2 instance hostnames

When you create an EC2 instance, AWS creates a hostname for that instance. For more information on the types of hostnames and how they're provisioned by AWS, see [Amazon EC2 instance hostname types \(p. 1250\)](#). Amazon provides a DNS server that resolves Amazon-provided hostnames to IPv4 and IPv6 addresses. The Amazon DNS server is located at the base of your VPC network range plus two. For more information, see [DNS attributes for your VPC](#) in the *Amazon VPC User Guide*.

Amazon EC2 instance hostname types

This section describes the Amazon EC2 instance guest OS hostname types available when you launch instances into your VPC subnets.

The hostname distinguishes the EC2 instances on your network. You may use the hostname of an instance if, for example, you want to run scripts to communicate with some or all of the instances on your network.

Contents

- [Types of EC2 hostnames \(p. 1250\)](#)
- [Where you see Resource name and IP name \(p. 1251\)](#)
- [How to decide whether to choose Resource name or IP name \(p. 1252\)](#)
- [Modify Hostname type and DNS Hostname configurations \(p. 1253\)](#)

Types of EC2 hostnames

There are two hostname types for the guest OS hostname when EC2 instances are launched in a VPC:

- **IP name:** The legacy naming scheme where, when you launch an instance, the *private IPv4 address* of the instance is included in the hostname of the instance. The IP name exists for the life of the EC2 instance. When used as the Private DNS hostname, it will only return the private IPv4 address (A record).
- **Resource name:** When you launch an instance, the *EC2 instance ID* is included in the hostname of the instance. The resource name exists for the life of the EC2 instance. When used as the Private DNS hostname, it can return both the private IPv4 address (A record) and/or the IPv6 Global Unicast Address (AAAA record).

The EC2 instance guest OS hostname type depends on the subnet settings:

- If the instance is launched into an IPv4-only subnet, you can select either IP name or resource name.
- If the instance is launched into a dual-stack (IPv4+IPv6) subnet, you can select either IP name or resource name.
- If the instance is launched into an IPv6-only subnet, resource name is used automatically.

Contents

- [IP name \(p. 1251\)](#)
- [Resource name \(p. 1251\)](#)
- [The difference between IP name and Resource name \(p. 1251\)](#)

IP name

When you launch an EC2 instance with the **Hostname type** of **IP name**, the guest OS hostname is configured to use the private IPv4 address.

- Format for an instance in us-east-1: *private-ipv4-address.ec2.internal*
- Example: *ip-10-24-34-0.ec2.internal*
- Format for an instance in any other AWS Region: *private-ipv4-address.region.compute.internal*
- Example: *ip-10-24-34-0.us-west-2.compute.internal*

Resource name

When you launch EC2 instances in IPv6-only subnets, the **Hostname type** of **Resource name** is selected by default. When you launch an instance in IPv4-only or dual-stack (IPv4+IPv6) subnets, **Resource name** is an option that you can select. After you launch an instance, you can manage the hostname configuration. For more information, see [Modify Hostname type and DNS Hostname configurations \(p. 1253\)](#).

When you launch an EC2 instance with a **Hostname type** of **Resource name**, the guest OS hostname is configured to use the EC2 instance ID.

- Format for an instance in us-east-1: *ec2-instance-id.ec2.internal*
- Example: *i-0123456789abcdef.ec2.internal*
- Format for an instance in any other AWS Region: *ec2-instance-id.region.compute.internal*
- Example: *i-0123456789abcdef.us-west-2.compute.internal*

The difference between IP name and Resource name

DNS queries for both IP names and resource names coexist to ensure backward compatibility and to allow you to migrate from IP based-naming for hostnames to resource-based naming. For private DNS hostnames based on IP names, you cannot configure whether a DNS A record query for the instance is responded to or not. DNS A record queries are always responded to irrespective of the guest OS hostname settings. In contrast, for private DNS hostnames based on resource name, you can configure whether DNS A and/or DNS AAAA queries for the instance are responded to or not. You configure the response behavior when you launch an instance or modify a subnet. For more information, see [Modify Hostname type and DNS Hostname configurations \(p. 1253\)](#).

Where you see Resource name and IP name

This section describes where you see the hostname types resource name and IP name in the EC2 console.

Contents

- [When creating an EC2 instance \(p. 1251\)](#)
- [When viewing the details of an existing EC2 instance \(p. 1252\)](#)

When creating an EC2 instance

When you create an EC2 instance, depending on which type of subnet you select, **Hostname type** of **Resource name** might be available or it might be selected and not be modifiable. This section explains the scenarios in which you see the hostname types resource name and IP name.

Scenario 1

You create an EC2 instance in the wizard (see [Launch an instance using the new launch instance wizard \(p. 552\)](#)) and, when you configure the details, you choose a subnet that you configured to be IPv6-only.

In this case, the **Hostname type** of **Resource name** is selected automatically and is not modifiable. **DNS Hostname** options of **Enable IP name IPv4 (A record) DNS requests** and **Enable resource-based IPv4 (A record) DNS requests** are deselected automatically and are not modifiable. **Enable resource-based IPv6 (AAAA record) DNS requests** is selected by default but is modifiable. If selected, DNS requests to the resource name will resolve to the IPv6 address (AAAA record) of this EC2 instance.

Scenario 2

You create an EC2 instance in the wizard (see [Launch an instance using the new launch instance wizard \(p. 552\)](#)) and, when you configure the details, you choose a subnet configured with an IPv4 CIDR block or both an IPv4 and IPv6 CIDR block ("dual stack").

In this case, **Enable IP name IPv4 (A record) DNS requests** is selected automatically and can't be changed. This means that requests to the IP name will resolve to the IPv4 address (A record) of this EC2 instance.

The options default to the configurations of the subnet, but you can modify the options for this instance depending on the subnet settings:

- **Hostname type:** Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name. The default value is **IP name**.
- **Enable resource-based IPv4 (A record) DNS requests:** Determines whether requests to your resource name resolve to the private IPv4 address (A record) of this EC2 instance. This option is not selected by default.
- **Enable resource-based IPv6 (AAAA record) DNS requests:** Determines whether requests to your resource name resolve to the IPv6 GUA address (AAAA record) of this EC2 instance. This option is not selected by default.

When viewing the details of an existing EC2 instance

You can see the hostname values for an existing EC2 instance in the **Details** tab for the EC2 instance:

- **Hostname type:** The hostname in IP name or resource name format.
- **Private IP DNS name (IPv4 only):** The IP name that will always resolve to the private IPv4 address of the instance.
- **Private resource DNS name:** The resource name that resolves to the DNS records selected for this instance.
- **Answer private resource DNS name:** The resource name resolves to IPv4 (A), IPv6 (AAAA) or IPv4 and IPv6 (A and AAAA) DNS records.

In addition, if you connect to your EC2 instance directly over SSH and enter the hostname command, you'll see the hostname in either the IP name or resource name format.

How to decide whether to choose Resource name or IP name

When you launch an EC2 instance (see [Launch an instance using the new launch instance wizard \(p. 552\)](#)), if you choose a **Hostname type** of **Resource name**, the EC2 instance launches with

a hostname in the resource name format. In such cases, the DNS record for this EC2 instance can also point to the resource name. This gives you the flexibility to choose whether that hostname resolves to the IPv4 address, the IPv6 address, or both the IPv4 and IPv6 address of the instance. If you plan to use IPv6 in the future or if you are using dual-stack subnets today, it's best to use a **Hostname type of Resource name** so that you change DNS resolution for the hostnames of your instances without making any changes to the DNS records themselves. The resource name allows you to add and remove IPv4 and IPv6 DNS resolution on an EC2 instance.

If instead you choose a **Hostname type of IP name**, and use it as the DNS hostname, it can only resolve to the IPv4 address of the instance. It will not resolve to the IPv6 address of the instance even if the instance has both an IPv4 address and an IPv6 address associated with it.

Modify Hostname type and DNS Hostname configurations

Follow the steps in this section to modify Hostname type and DNS Hostname configurations for subnets or EC2 instances after they've been launched.

Contents

- [Subnets \(p. 1253\)](#)
- [EC2 instances \(p. 1253\)](#)

Subnets

Modify the configurations for a subnet by selecting a subnet in the VPC console and choosing **Actions**, **Edit subnet settings**.

Note

Changing the subnet settings doesn't change the configuration of EC2 instances that are already launched in the subnet.

- **Hostname type:** Determines whether you want the default setting of the guest OS hostname of the EC2 instance launched in the subnet to be the resource name or IP name.
- **Enable DNS hostname IPv4 (A record) requests:** Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address (A record) of this EC2 instance.
- **Enable DNS hostname IPv6 (AAAA record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.

EC2 instances

Follow the steps in this section to modify the Hostname type and DNS Hostname configurations for an EC2 instance.

Important

- To change the **Use resource based naming as guest OS hostname** setting, you must first stop the instance. To change the **Answer DNS hostname IPv4 (A record) request** or **Answer DNS hostname IPv6 (AAAA record) requests** settings, you don't have to stop the instance.
- To modify any of the settings for non-EBS backed EC2 instance types, you cannot stop the instance. You must terminate the instance and launch a new instance with the desired Hostname type and DNS Hostname configurations.

To modify the Hostname type and DNS Hostname configurations for an EC2 instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. If you're going to change the **Use resource based naming as guest OS hostname** setting, first stop the EC2 instance. Otherwise, skip this step.

To stop the instance, select the instance and choose **Instance state, Stop instance**.
3. Select the instance and choose **Actions, Instance settings, Change resource based naming options**.
 - **Use resource based naming as guest OS hostname:** Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name.
 - **Answer DNS hostname IPv4 (A record) requests:** Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address of this EC2 instance.
 - **Answer DNS hostname IPv6 (AAAA record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.
4. Choose **Save**.
5. If you stopped the instance, start it again.

Bring your own IP addresses (BYOIP) in Amazon EC2

You can bring part or all of your publicly routable IPv4 or IPv6 address range from your on-premises network to your AWS account. You continue to control the address range and you can advertise the address range on the internet through AWS. After you bring the address range to AWS, it appears in your AWS account as an address pool.

For a list of Regions where BYOIP is available, see [Regional availability \(p. 1268\)](#).

Note

- The steps on this page describe how to bring your own IP address range for use in Amazon EC2 only.
- To bring your own IP address range for use in AWS Global Accelerator, see [Bring your own IP addresses \(BYOIP\) in the AWS Global Accelerator Developer Guide](#).
- To bring your own IP address range for use with Amazon VPC IP Address Manager, see [Tutorial: Bring your IP addresses to IPAM](#) in the [Amazon VPC IPAM User Guide](#).

Contents

- [BYOIP definitions \(p. 1255\)](#)
- [Requirements and quotas \(p. 1255\)](#)
- [Onboarding prerequisites for your BYOIP address range \(p. 1256\)](#)
- [Onboard your BYOIP \(p. 1262\)](#)

BYOIP definitions

- **X.509 Self-sign certificate** — A certificate standard most commonly used to encrypt and authenticate data within a network. It is a certificate used by AWS to validate control over IP space from an RDAP record. For more information about X.509 certificates, see [RFC 3280](#).
- **Autonomous System Number (ASN)** — A globally unique identifier that defines a group of IP prefixes run by one or more network operators that maintain a single, clearly-defined routing policy.
- **Regional Internet Registry (RIR)** — An organization that manages allocation and registration of IP addresses and ASNs within a region of the world.
- **Registry Data Access Protocol (RDAP)** — A read-only protocol to query current registration data within a RIR. Entries within the queried RIR database are referred to as "RDAP records". Certain record types need to be updated by customers via a RIR-provided mechanism. These records are queried by AWS to verify control of an address space in the RIR.
- **Route Origin Authorization (ROA)** — An object created by RIRs for customers to authenticate IP advertisement in particular autonomous systems. For an overview, see [Route Origin Authorizations \(ROAs\)](#) on the ARIN website.
- **Local Internet Registry (LIR)** — Organizations such as internet service providers that allocate a block of IP addresses from an RIR for their customers.

Requirements and quotas

- The address range must be registered with your regional internet registry (RIR). BYOIP currently supports registration in the American Registry for Internet Numbers (ARIN), Réseaux IP Européens Network Coordination Centre (RIPE), or Asia-Pacific Network Information Centre (APNIC). It must be registered to a business or institutional entity and cannot be registered to an individual person.
- The most specific IPv4 address range that you can bring is /24.
- The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertised, and /56 for CIDRs that are [not publicly advertised \(p. 1263\)](#).
- ROAs are not required for CIDR ranges that are not publicly advertised, but the RDAP records still need to be updated.
- You can bring each address range to one Region at a time.
- You can bring a total of five BYOIP IPv4 and IPv6 address ranges per Region to your AWS account. You cannot adjust the quotas for BYOIP CIDRs using the Service Quotas console, but you can request a quota increase by contacting the AWS Support Center as described in [AWS service quotas](#) in the [AWS General Reference](#).
- You cannot share your IP address range with other accounts using AWS RAM unless you use Amazon VPC IP Address Manager (IPAM) and integrate IPAM with AWS Organizations. For more information, see [Integrate IPAM with AWS Organizations](#) in the [Amazon VPC IPAM User Guide](#).
- The addresses in the IP address range must have a clean history. We might investigate the reputation of the IP address range and reserve the right to reject an IP address range if it contains an IP address that has a poor reputation or is associated with malicious behavior.
- Legacy address space, the IPv4 address space that was distributed by the Internet Assigned Numbers Authority's (IANA) central registry prior to the formation of the Regional Internet Registry (RIR) system, still requires a corresponding ROA object.
- For LIRs, it is common that they use a manual process to update their records. This can take days to deploy depending on the LIR.
- A single ROA object and RDAP record are needed for a large CIDR block. You can bring multiple smaller CIDR blocks from that range to AWS, even across multiple Regions, using the single object and record.
- BYOIP is not supported for Local Zones, Wavelength Zones, or on AWS Outposts.

- Do not make any manual changes for BYOIP in RADb or any other LIR. BYOIP will automatically update RADb. Any manual changes that include the BYOIP ASN will cause the BYOIP provision operation to fail.

Onboarding prerequisites for your BYOIP address range

The onboarding process for BYOIP has two phases, for which you must perform three steps. These steps correspond to the steps depicted in the following diagram. We include manual steps in this documentation, but your RIR might offer managed services to help you with these steps.

Preparation phase

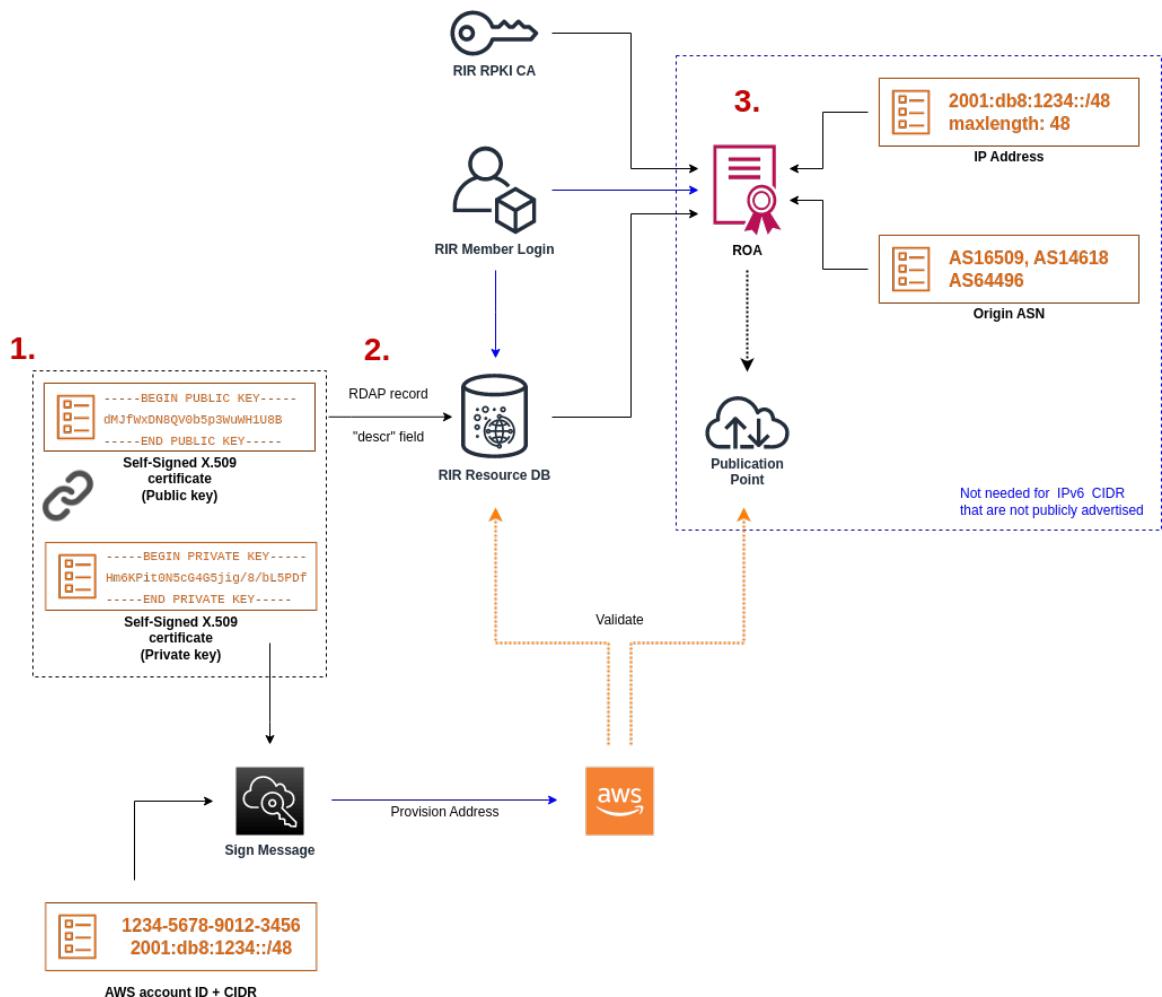

1. [Create an RSA key pair \(p. 1257\)](#), and use it to generate a self-signed X.509 certificate for authentication purposes. This certificate is only used during the provisioning phase.

RIR configuration phase

2. [Upload the self-signed certificate \(p. 1261\)](#) to your RDAP record comments.
3. [Create a ROA object \(p. 1261\)](#) in your RIR. The ROA defines the desired address range, the Autonomous System Numbers (ASNs) allowed to advertise the address range, and an expiration date to register with the Resource Public Key Infrastructure (RPKI) of your RIR.

Note

A ROA is not required for non-publicly advertised IPv6 address space.

To bring on multiple non-contiguous address ranges, you must repeat this process with each address range. However, the preparation and RIR configuration steps don't need to be repeated if splitting a contiguous block across several different Regions.

Bringing on an address range has no effect on any address ranges that you brought on previously.

Before onboarding your address range, complete the following prerequisites. For some tasks, you run Linux commands. On Windows, you can use the [Windows Subsystem for Linux](#) to run the Linux commands.

1. Create a key pair for AWS authentication

Use the following procedure to create a self-signed X.509 certificate and add it to the RDAP record for your RIR. This key pair is used to authenticate the address range with the RIR. The **openssl** commands require OpenSSL version 1.0.2 or later.

Copy the following commands and replace only the placeholder values (in colored italic text).

To create a self-signed X.509 certificate and add it to the RDAP record

This procedure follows the best practice of encrypting your private RSA key and requiring a passphrase to access it.

1. Generate an RSA 2048-bit key pair as shown in the following.

```
$ openssl genpkey -aes256 -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -out private-key.pem
```

The `-aes256` parameter specifies the algorithm used to encrypt the private key. The command returns the following output, including prompts to set a passphrase:

```
.....+++
.+++
Enter PEM pass phrase: xxxxxx
Verifying - Enter PEM pass phrase: xxxxxx
```

You can inspect the key using the following command:

```
$ openssl pkey -in private-key.pem -text
```

This returns a passphrase prompt and the contents of the key, which should be similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxx
-----BEGIN PRIVATE KEY-----

9a:77:5a:e5:87:d5:4f:01
```

Keep your private key in a secure location when it is not in use.

2. Generate your public key from the private key as follows. You will use this later to test that your signed authorization message validates correctly.

```
$ openssl rsa -in private-key.pem -pubout > public-key.pem
```

On inspection, your public key should look like this:

```
$ cat public-key.pem
-----BEGIN PUBLIC KEY-----
MIIBIjANBggqhkiG9w0BAQEFAAOCAQ8AMIIIBCgKCAQEAxQVx0S0B1SgIYd7HonIq
KISwkU2yXtfmLMU42uF8isqVRiBVgx0Wb00BQh5Tzjk1Sfjaj++MPeqD0wz0t8a
PZGkMmQRZ9mBKdhAaub3990yhzUZmWVJpJ9MxzkhKTZmNnzMSEgcXsJcURQJ4sJk
nf/Ew7xyTGRbwCL1rk7L+ZdLSSpPmvdsuPrTt1H0e0p60VlxMX7Aa1t4NcnaN0
wbMFiuF211TnDQKcu4HtvxYsGN2gLyQeq+p7heh/JkYCOK+L5DEbDpQISQ52TzXs
Hm6KPit0N5cG4G5jig/8/bL5PDF/oVEwbSF9H0bwXvjjyyMN8VkrxqzEp9gc7D1bg
ywIDAQAB
-----END PUBLIC KEY-----
```

3. Generate an X.509 certificate using the key pair created in the previous. In this example, the certificate expires in 365 days, after which time it cannot be trusted. Be sure to set the expiration appropriately. The `tr -d "\n"` command strips newline characters (line breaks) from the output. You need to provide a Common Name when prompted, but the other fields can be left blank.

```
$ openssl req -new -x509 -key private-key.pem -days 365 | tr -d "\n" > certificate.pem
```

This results in output similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxxxx
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
Organizational Unit Name (eg, section) []:
Common Name (eg, fully qualified host name) []:example.com
Email Address []:
```

Note

The Common Name is not needed for AWS provisioning. It can be any internal or public domain name.

You can inspect the certificate with the following command:

```
$ cat certificate.pem
```

The output should be a long, PEM-encoded string without line breaks, prefaced by -----BEGIN CERTIFICATE----- and followed by -----END CERTIFICATE-----.

2. Upload the public key to the RDAP record in your RIR

Add the certificate that you previously created to the RDAP record for your RIR. Be sure to include the -----BEGIN CERTIFICATE----- and -----END CERTIFICATE----- strings before and after the encoded portion. All of this content must be on a single, long line. The procedure for updating RDAP depends on your RIR:

- For ARIN, use the [Account Manager portal](#) to add the certificate in the "Public Comments" section for the "Network Information" object representing your address range. Do not add it to the comments section for your organization.
- For RIPE, add the certificate as a new "descr" field to the "inetnum" or "inet6num" object representing your address range. These can usually be found in the "My Resources" section of the [RIPE Database portal](#). Do not add it to the comments section for your organization or the "remarks" field of the above objects.
- For APNIC, email the certificate to helpdesk@apnic.net to manually add it to the "remarks" field for your address range. Send the email using the APNIC authorized contact for the IP addresses.

You can remove the certificate from your RIR's record after the provisioning stage below has been completed.

3. Create a ROA object in your RIR

Create a ROA object to authorize the Amazon ASNs 16509 and 14618 to advertise your address range, as well as the ASNs that are currently authorized to advertise the address range. For the AWS GovCloud (US) Regions, authorize ASN 8987 instead of 16509 and 14618. You must set the maximum length to the size of the CIDR that you are bringing in. The most specific IPv4 prefix you can bring is /24. The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertised and /56 for CIDRs that are not publicly advertised.

Important

If you are creating a ROA object for Amazon VPC IP Address Manager (IPAM), when you create the ROAs, for IPv4 CIDRs you must set the maximum length of an IP address prefix to /24. For IPv6 CIDRs, if you are adding them to an advertisable pool, the maximum length of an IP address prefix must be /48. This ensures that you have full flexibility to divide your public IP address across AWS Regions. IPAM enforces the maximum length you set. For more information about BYOIP addresses to IPAM, see [Tutorial: BYOIP address CIDRs to IPAM](#) in the *Amazon VPC IPAM User Guide*.

It might take up to 24 hours for the ROA to become available to Amazon. For more information, consult your RIR:

- ARIN — [ROA Requests](#)
- RIPE — [Managing ROAs](#)
- APNIC — [Route Management](#)

When you migrate advertisements from an on-premises workload to AWS, you must create a ROA for your existing ASN before creating the ROAs for Amazon's ASNs. Otherwise, you might see an impact to your existing routing and advertisements.

Note

This step is not required for non-publicly advertised IPv6 address space.

Onboard your BYOIP

The onboarding process for BYOIP has the following tasks depending on your needs:

Topics

- [Provision a publicly advertised address range in AWS \(p. 1262\)](#)
- [Provision an IPv6 address range that's not publicly advertised \(p. 1263\)](#)
- [Advertise the address range through AWS \(p. 1263\)](#)
- [Deprovision the address range \(p. 1264\)](#)

Provision a publicly advertised address range in AWS

When you provision an address range for use with AWS, you are confirming that you control the address range and are authorizing Amazon to advertise it. We also verify that you control the address range through a signed authorization message. This message is signed with the self-signed X.509 key pair that you used when updating the RDAP record with the X.509 certificate. AWS requires a cryptographically signed authorization message that it presents to the RIR. The RIR authenticates the signature against the certificate that you added to RDAP, and checks the authorization details against the ROA.

To provision the address range

1. **Compose message**

Compose the plaintext authorization message. The format of the message is as follows, where the date is the expiry date of the message:

```
1|aws|account|cidr|YYYYMMDD|SHA256|RSAPSS
```

Replace the account number, address range, and expiry date with your own values to create a message resembling the following:

```
text_message="1|aws|0123456789AB|198.51.100.0/24|20211231|SHA256|RSAPSS"
```

This is not to be confused with a ROA message, which has a similar appearance.

2. **Sign message**

Sign the plaintext message using the private key that you created previously. The signature returned by this command is a long string that you need to use in the next step.

Important

We recommend that you copy and paste this command. Except for the message content, do not modify or replace any of the values.

```
signed_message=$( echo -n $text_message | openssl dgst -sha256 -sigopt  
rsa_padding_mode:pss -sigopt rsa_pss_saltlen:-1 -sign private-key.pem -keyform PEM |  
openssl base64 | tr -- '+=/ '-_~' | tr -d "\n")
```

3. Provision address

Use the AWS CLI [provision-byoip-cidr](#) command to provision the address range. The `--cidr-authorization-context` option uses the message and signature strings that you created previously.

Important

You must specify the AWS Region where the BYOIP range should be provisioned if it differs from your [AWS CLI configuration](#) Default region name.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context  
Message="$text_message",Signature="$signed_message" --region us-east-1
```

Provisioning an address range is an asynchronous operation, so the call returns immediately, but the address range is not ready to use until its status changes from pending-provision to provisioned.

4. Monitor progress

It can take up to one week to complete the provisioning process for publicly advertisable ranges. Use the [describe-byoip-cidrs](#) command to monitor progress, as in this example:

```
aws ec2 describe-byoip-cidrs --max-results 5 --region us-east-1
```

If there are issues during provisioning and the status goes to failed-provision, you must run the `provision-byoip-cidr` command again after the issues have been resolved.

Provision an IPv6 address range that's not publicly advertised

By default, an address range is provisioned to be publicly advertised to the internet. You can provision an IPv6 address range that will not be publicly advertised. For routes that are not publicly advertisable, the provisioning process generally completes within minutes. When you associate an IPv6 CIDR block from a non-public address range with a VPC, the IPv6 CIDR can only be accessed through hybrid connectivity options that support IPv6, such as [AWS Direct Connect](#), [AWS Site-to-Site VPN](#), or [Amazon VPC Transit Gateways](#).

A ROA is not required to provision a non-public address range.

Important

- You can only specify whether an address range is publicly advertised during provisioning. You cannot change the advertisable status later on.
- Amazon VPC doesn't support [unique local address](#) (ULA) CIDRs. All VPCs must have unique IPv6 CIDRs. Two VPCs can't have the same IPv6 CIDR range.

To provision an IPv6 address range that will not be publicly advertised, use the following [provision-byoip-cidr](#) command.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context  
Message="$text_message",Signature="$signed_message" --no-publicly-advertisible --  
region us-east-1
```

Advertise the address range through AWS

After the address range is provisioned, it is ready to be advertised. You must advertise the exact address range that you provisioned. You can't advertise only a portion of the provisioned address range.

If you provisioned an IPv6 address range that will not be publicly advertised, you do not need to complete this step.

We recommend that you stop advertising the address range from other locations before you advertise it through AWS. If you keep advertising your IP address range from other locations, we can't reliably support it or troubleshoot issues. Specifically, we can't guarantee that traffic to the address range will enter our network.

To minimize down time, you can configure your AWS resources to use an address from your address pool before it is advertised, and then simultaneously stop advertising it from the current location and start advertising it through AWS. For more information about allocating an Elastic IP address from your address pool, see [Allocate an Elastic IP address \(p. 1270\)](#).

Limitations

- You can run the **advertise-byoip-cidr** command at most once every 10 seconds, even if you specify different address ranges each time.
- You can run the **withdraw-byoip-cidr** command at most once every 10 seconds, even if you specify different address ranges each time.

To advertise the address range, use the following [advertise-byoip-cidr](#) command.

```
aws ec2 advertise-byoip-cidr --cidr address-range --region us-east-1
```

To stop advertising the address range, use the following [withdraw-byoip-cidr](#) command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

Deprovision the address range

To stop using your address range with AWS, first release any Elastic IP addresses and disassociate any IPv6 CIDR blocks that are still allocated from the address pool. Then stop advertising the address range, and finally, deprovision the address range.

You cannot deprovision a portion of the address range. If you want to use a more specific address range with AWS, deprovision the entire address range and provision a more specific address range.

(IPv4) To release each Elastic IP address, use the following [release-address](#) command.

```
aws ec2 release-address --allocation-id eipalloc-12345678abca --region us-east-1
```

(IPv6) To disassociate an IPv6 CIDR block, use the following [disassociate-vpc-cidr-block](#) command.

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-12345abcd1234abc1 --region us-east-1
```

To stop advertising the address range, use the following [withdraw-byoip-cidr](#) command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

To deprovision the address range, use the following [deprovision-byoip-cidr](#) command.

```
aws ec2 deprovision-byoip-cidr --cidr address-range --region us-east-1
```

It can take up to a day to deprovision an address range.

Work with your address range

You can view and use the IPv4 and IPv6 address ranges that you've provisioned in your account.

IPv4 address ranges

You can create an Elastic IP address from your IPv4 address pool and use it with your AWS resources, such as EC2 instances, NAT gateways, and Network Load Balancers.

To view information about the IPv4 address pools that you've provisioned in your account, use the following [describe-public-ipv4-pools](#) command.

```
aws ec2 describe-public-ipv4-pools --region us-east-1
```

To create an Elastic IP address from your IPv4 address pool, use the [allocate-address](#) command. You can use the `--public-ipv4-pool` option to specify the ID of the address pool returned by `describe-byoip-cidrs`. Or you can use the `--address` option to specify an address from the address range that you provisioned.

IPv6 address ranges

To view information about the IPv6 address pools that you've provisioned in your account, use the following [describe-ipv6-pools](#) command.

```
aws ec2 describe-ipv6-pools --region us-east-1
```

To create a VPC and specify an IPv6 CIDR from your IPv6 address pool, use the following [create-vpc](#) command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 create-vpc --cidr-block 10.0.0.0/16 --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id --region us-east-1
```

To associate an IPv6 CIDR block from your IPv6 address pool with a VPC, use the following [associate-vpc-cidr-block](#) command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 associate-vpc-cidr-block --vpc-id vpc-123456789abc123ab --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id --region us-east-1
```

To view your VPCs and the associated IPv6 address pool information, use the [describe-vpcs](#) command. To view information about associated IPv6 CIDR blocks from a specific IPv6 address pool, use the following [get-associated-ipv6-pool-cidrs](#) command.

```
aws ec2 get-associated-ipv6-pool-cidrs --pool-id pool-id --region us-east-1
```

If you disassociate the IPv6 CIDR block from your VPC, it's released back into your IPv6 address pool.

Validate your BYOIP

1. Validate the self-signed x.509 key pair

Validate that the certificate has been uploaded and is valid via the whois command.

For ARIN, use `whois -h whois.arin.net r + 2001:0DB8:6172::/48` to look up the RDAP record for your address range. Check the Public Comments section for the NetRange (network range) in the command output. The certificate should be added in the Public Comments section for the address range.

You can inspect the Public Comments containing the certificate using the following command:

```
whois -h whois.arin.net r + 2001:0DB8:6172::/48 | grep Comments | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```
Public Comments:

For RIPE, use `whois -r -h whois.ripe.net 2001:0DB8:7269::/48` to look up the RDAP record for your address range. Check the descr section for the inetnum object (network range) in the command output. The certificate should be added as a new descr field for the address range.

You can inspect the descr containing the certificate using the following command:

```
whois -r -h whois.ripe.net 2001:0DB8:7269::/48 | grep descr | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```

2. Validate the creation of a ROA object

Validate the successful creation of the ROA objects using the RIPEstat Data API. Be sure to test your address range against the Amazon ASNs 16509 and 14618, plus the ASNs that are currently authorized to advertise the address range.

You can inspect the ROA objects from different Amazon ASNs with your address range by using the following command:

```
curl --location --request GET "https://stat.ripe.net/data/rpki-validation/data.json?
resource=ASN&prefix=CIDR"
```

In this example output, the response has a result of "status": "valid" for the Amazon ASN 16509. This indicates the ROA object for the address range was created successfully:

```
{  
    "messages": [],  
    "see_also": [],  
    "version": "0.3",  
    "data_call_name": "rpki-validation",  
    "data_call_status": "supported",  
    "cached": false,  
    "data": {  
        "validating_roas": [  
            {  
                "origin": "16509",  
                "prefix": "2001:0DB8::/32",  
                "max_length": 48,  
                "validity": "valid"  
            },  
            {  
                "origin": "14618",  
                "prefix": "2001:0DB8::/32",  
                "max_length": 48,  
                "validity": "invalid_asn"  
            },  
            {  
                "origin": "64496",  
                "prefix": "2001:0DB8::/32",  
                "max_length": 48,  
                "validity": "invalid_asn"  
            }  
        ],  
        "status": "valid",  
        "validator": "routinator",  
        "resource": "16509",  
        "prefix": "2001:0DB8::/32"  
    },  
    "query_id": "20230224152430-81e6384e-21ba-4a86-852a-31850787105f",  
    "process_time": 58,  
    "server_id": "app116",  
    "build_version": "live.2023.2.1.142",  
    "status": "ok",  
    "status_code": 200,  
    "time": "2023-02-24T15:24:30.773654"  
}
```

A status of "unknown" indicates the ROA object for the address range has not been created. A status of "invalid_asn" indicates that the ROA object for the address range was not created successfully.

Regional availability

The BYOIP feature is currently available in all commercial [AWS Regions](#) except for China Regions.

Learn more

For more information, see the AWS Online Tech talk [Deep Dive on Bring Your Own IP](#).

Elastic IP addresses

An *Elastic IP address* is a static IPv4 address designed for dynamic cloud computing. An Elastic IP address is allocated to your AWS account, and is yours until you release it. By using an Elastic IP address, you can mask the failure of an instance or software by rapidly remapping the address to another instance in your account. Alternatively, you can specify the Elastic IP address in a DNS record for your domain, so that your domain points to your instance. For more information, see the documentation for your domain registrar.

An Elastic IP address is a public IPv4 address, which is reachable from the internet. If your instance does not have a public IPv4 address, you can associate an Elastic IP address with your instance to enable communication with the internet. For example, this allows you to connect to your instance from your local computer.

Contents

- [Elastic IP address pricing \(p. 1269\)](#)
- [Elastic IP address basics \(p. 1269\)](#)
- [Work with Elastic IP addresses \(p. 1270\)](#)
- [Elastic IP address limit \(p. 1280\)](#)

Elastic IP address pricing

To ensure efficient use of Elastic IP addresses, we impose a small hourly charge if an Elastic IP address is not associated with a running instance, or if it is associated with a stopped instance or an unattached network interface. While your instance is running, you are not charged for one Elastic IP address associated with the instance, but you are charged for any additional Elastic IP addresses associated with the instance.

For more information, see Elastic IP Addresses on the [Amazon EC2 Pricing, On-Demand Pricing page](#).

Elastic IP address basics

The following are the basic characteristics of an Elastic IP address:

- An Elastic IP address is static; it does not change over time.
- An Elastic IP address is for use in a specific Region only, and cannot be moved to a different Region.
- An Elastic IP address comes from Amazon's pool of IPv4 addresses, or from a custom IPv4 address pool that you have brought to your AWS account.
- To use an Elastic IP address, you first allocate one to your account, and then associate it with your instance or a network interface.
- When you associate an Elastic IP address with an instance, it is also associated with the instance's primary network interface. When you associate an Elastic IP address with a network interface that is attached to an instance, it is also associated with the instance.
- When you associate an Elastic IP address with an instance or its primary network interface, the instance's public IPv4 address (if it had one) is released back into Amazon's pool of public IPv4 addresses. You cannot reuse a public IPv4 address, and you cannot convert a public IPv4 address to an Elastic IP address. For more information, see [Public IPv4 addresses \(p. 1236\)](#).
- You can disassociate an Elastic IP address from a resource, and then associate it with a different resource. To avoid unexpected behavior, ensure that all active connections to the resource named in the existing association are closed before you make the change. After you have associated your Elastic IP address to a different resource, you can reopen your connections to the newly associated resource.
- A disassociated Elastic IP address remains allocated to your account until you explicitly release it. We impose a small hourly charge for Elastic IP addresses that are not associated with a running instance.

- When you associate an Elastic IP address with an instance that previously had a public IPv4 address, the public DNS host name of the instance changes to match the Elastic IP address.
- We resolve a public DNS host name to the public IPv4 address or the Elastic IP address of the instance outside the network of the instance, and to the private IPv4 address of the instance from within the network of the instance.
- When you allocate an Elastic IP address from an IP address pool that you have brought to your AWS account, it does not count toward your Elastic IP address limits. For more information, see [Elastic IP address limit \(p. 1280\)](#).
- When you allocate the Elastic IP addresses, you can associate the Elastic IP addresses with a network border group. This is the location from which we advertise the CIDR block. Setting the network border group limits the CIDR block to this group. If you do not specify the network border group, we set the border group containing all of the Availability Zones in the Region (for example, us-west-2).
- An Elastic IP address is for use in a specific network border group only.

Work with Elastic IP addresses

The following sections describe how you can work with Elastic IP addresses.

Tasks

- [Allocate an Elastic IP address \(p. 1270\)](#)
- [Describe your Elastic IP addresses \(p. 1271\)](#)
- [Tag an Elastic IP address \(p. 1271\)](#)
- [Associate an Elastic IP address with an instance or network interface \(p. 1272\)](#)
- [Disassociate an Elastic IP address \(p. 1273\)](#)
- [Transfer Elastic IP addresses \(p. 1274\)](#)
- [Release an Elastic IP address \(p. 1277\)](#)
- [Recover an Elastic IP address \(p. 1278\)](#)
- [Use reverse DNS for email applications \(p. 1278\)](#)

Allocate an Elastic IP address

You can allocate an Elastic IP address from Amazon's pool of public IPv4 addresses, or from a custom IP address pool that you have brought to your AWS account. For more information about bringing your own IP address range to your AWS account, see [Bring your own IP addresses \(BYOIP\) in Amazon EC2 \(p. 1254\)](#).

You can allocate an Elastic IP address using one of the following methods.

Console

To allocate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network & Security, Elastic IPs**.
3. Choose **Allocate Elastic IP address**.
4. For **Public IPv4 address pool**, choose one of the following:
 - **Amazon's pool of IPv4 addresses**—If you want an IPv4 address to be allocated from Amazon's pool of IPv4 addresses.
 - **Public IPv4 address that you bring to your AWS account**—If you want to allocate an IPv4 address from an IP address pool that you have brought to your AWS account. This option is disabled if you do not have any IP address pools.

- **Customer owned pool of IPv4 addresses**—If you want to allocate an IPv4 address from a pool created from your on-premises network for use with an AWS Outpost. This option is disabled if you do not have an AWS Outpost.
5. (Optional) Add or remove a tag.

[Add a tag] Choose **Add new tag** and do the following:

- For **Key**, enter the key name.
- For **Value**, enter the key value.

[Remove a tag] Choose **Remove** to the right of the tag's Key and Value.

6. Choose **Allocate**.

AWS CLI

To allocate an Elastic IP address

Use the [allocate-address](#) AWS CLI command.

PowerShell

To allocate an Elastic IP address

Use the [New-EC2Address](#) AWS Tools for Windows PowerShell command.

Describe your Elastic IP addresses

You can describe an Elastic IP address using one of the following methods.

Console

To describe your Elastic IP addresses

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to view and choose **Actions, View details**.

AWS CLI

To describe your Elastic IP addresses

Use the [describe-addresses](#) AWS CLI command.

PowerShell

To describe your Elastic IP addresses

Use the [Get-EC2Address](#) AWS Tools for Windows PowerShell command.

Tag an Elastic IP address

You can assign custom tags to your Elastic IP addresses to categorize them in different ways, for example, by purpose, owner, or environment. This helps you to quickly find a specific Elastic IP address based on the custom tags that you assigned to it.

Cost allocation tracking using Elastic IP address tags is not supported.

You can tag an Elastic IP address using one of the following methods.

Console

To tag an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to tag and choose **Actions, View details**.
4. In the **Tags** section, choose **Manage tags**.
5. Specify a tag key and value pair.
6. (Optional) Choose **Add tag** to add additional tags.
7. Choose **Save**.

AWS CLI

To tag an Elastic IP address

Use the [create-tags](#) AWS CLI command.

```
aws ec2 create-tags --resources eipalloc-12345678 --tags Key=Owner,Value=TeamA
```

PowerShell

To tag an Elastic IP address

Use the [New-EC2Tag](#) AWS Tools for Windows PowerShell command.

The New-EC2Tag command needs a Tag parameter, which specifies the key and value pair to be used for the Elastic IP address tag. The following commands create the Tag parameter.

```
PS C:\> $tag = New-Object Amazon.EC2.Model.Tag
PS C:\> $tag.Key = "Owner"
PS C:\> $tag.Value = "TeamA"
```

```
PS C:\> New-EC2Tag -Resource eipalloc-12345678 -Tag $tag
```

Associate an Elastic IP address with an instance or network interface

If you're associating an Elastic IP address with your instance to enable communication with the internet, you must also ensure that your instance is in a public subnet. For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

You can associate an Elastic IP address with an instance or network interface using one of the following methods.

Console

To associate an Elastic IP address with an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.

3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.
4. For **Resource type**, choose **Instance**.
5. For instance, choose the instance with which to associate the Elastic IP address. You can also enter text to search for a specific instance.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

To associate an Elastic IP address with a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.
4. For **Resource type**, choose **Network interface**.
5. For **Network interface**, choose the network interface with which to associate the Elastic IP address. You can also enter text to search for a specific network interface.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

AWS CLI

To associate an Elastic IP address

Use the [associate-address](#) AWS CLI command.

PowerShell

To associate an Elastic IP address

Use the [Register-EC2Address](#) AWS Tools for Windows PowerShell command.

Disassociate an Elastic IP address

You can disassociate an Elastic IP address from an instance or network interface at any time. After you disassociate the Elastic IP address, you can reassociate it with another resource.

You can disassociate an Elastic IP address using one of the following methods.

Console

To disassociate and reassociate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to disassociate, choose **Actions, Disassociate Elastic IP address**.
4. Choose **Disassociate**.

AWS CLI

To disassociate an Elastic IP address

Use the [disassociate-address](#) AWS CLI command.

PowerShell

To disassociate an Elastic IP address

Use the [Unregister-EC2Address](#) AWS Tools for Windows PowerShell command.

Transfer Elastic IP addresses

This section describes how to transfer Elastic IP addresses from one AWS account to another. Transferring Elastic IP addresses can be helpful in the following situations:

- **Organizational restructuring** – Use Elastic IP address transfers to quickly move workloads from one AWS account to another. You don't have to wait for new Elastic IP addresses to be allowlisted in your security groups and NACLs.
- **Centralized security administration** – Use a centralized AWS security account to track and transfer Elastic IP addresses that have been vetted for security compliance.
- **Disaster recovery** – Use Elastic IP address transfers to quickly remap IPs for public-facing internet workloads during emergency events.

There is no charge for transferring Elastic IP addresses.

Tasks

- [Enable Elastic IP address transfer \(p. 1274\)](#)
- [Disable Elastic IP address transfer \(p. 1275\)](#)
- [Accept a transferred Elastic IP address \(p. 1276\)](#)

Enable Elastic IP address transfer

This section describes how to accept a transferred Elastic IP address. Note the following limitations related to enabling Elastic IP addresses for transfer:

- You can transfer Elastic IP addresses from any AWS account (source account) to any other AWS account in the same AWS Region (transfer account).
- When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the [describe-address-transfers](#) AWS CLI command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.
- Accepted transfers are visible to the source account (for example in the AWS console or by using the [describe-address-transfers](#) AWS CLI command) for three days after the transfers have been accepted.
- AWS does not notify transfer accounts about pending Elastic IP address transfer requests. The owner of the source account must notify the owner of the transfer account that there is an Elastic IP address transfer request that they must accept.
- Any tags that are associated with an Elastic IP address being transferred are reset when the transfer is complete.
- You cannot transfer Elastic IP addresses allocated from public IPv4 address pools that you bring to your AWS account – commonly referred to as Bring Your Own IP (BYOIP) address pools.
- If you attempt to transfer an Elastic IP address that has a reverse DNS record associated with it, you can begin the transfer process, but the transfer account will not be able to accept the transfer until the associated DNS record is removed.
- If you have enabled and configured AWS Outposts, you might have allocated Elastic IP addresses from a customer-owned IP address pool (CoIP). You cannot transfer Elastic IP addresses allocated from a

ColP. However, you can use AWS RAM to share a ColP with another account. For more information, see [Customer-owned IP addresses in the AWS Outposts User Guide](#).

- You can use Amazon VPC IPAM to track the transfer of Elastic IP addresses to accounts in an organization from AWS Organizations. For more information, see [View IP address history](#). If an Elastic IP address is transferred to an AWS account outside of the organization, the IPAM audit history of the Elastic IP address is lost.

These steps must be completed by the source account.

Console

To enable Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Elastic IPs**.
4. Select one or more Elastic IP address to enable for transfer and choose **Actions, Enable transfer**.
5. If you are transferring multiple Elastic IP addresses, you'll see the **Transfer type** option. Choose one of the following options:
 - Choose **Single account** if you are transferring the Elastic IP addresses to a single AWS account.
 - Choose **Multiple accounts** if you are transferring the Elastic IP addresses to multiple AWS accounts.
6. Under **Transfer account ID**, enter the IDs of the AWS accounts that you want to transfer the Elastic IP addresses to.
7. Confirm the transfer by entering **enable** in the text box.
8. Choose **Submit**.
9. To accept the transfer, see [Accept a transferred Elastic IP address \(p. 1276\)](#). To disable the transfer, see [Disable Elastic IP address transfer \(p. 1275\)](#).

AWS CLI

To enable Elastic IP address transfer

Use the [enable-address-transfer](#) command.

PowerShell

To enable Elastic IP address transfer

Use the [Enable-EC2AddressTransfer](#) command.

Disable Elastic IP address transfer

This section describes how to disable an Elastic IP transfer after the transfer has been enabled.

These steps must be completed by the source account that enabled the transfer.

Console

To disable an Elastic IP address transfer

1. Ensure that you're using the source AWS account.

2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Elastic IPs**.
4. In the resource list of Elastic IPs, ensure that you have the property enabled that shows the column **Transfer status**.
5. Select one or more Elastic IP address that have a **Transfer status of Pending**, and choose **Actions, Disable transfer**.
6. Confirm by entering **disable** in the text box.
7. Choose **Submit**.

AWS CLI

To disable Elastic IP address transfer

Use the [disable-address-transfer](#) command.

PowerShell

To disable Elastic IP address transfer

Use the [Disable-EC2AddressTransfer](#) command.

Accept a transferred Elastic IP address

This section describes how to accept a transferred Elastic IP address.

When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the [describe-address-transfers](#) AWS CLI command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.

When accepting transfers, note the following exceptions that might occur and how to resolve them:

- **AddressLimitExceeded:** If your transfer account has exceeded the Elastic IP address quota, the source account can enable Elastic IP address transfer, but this exception occurs when the transfer account tries to accept the transfer. By default, all AWS accounts are limited to 5 Elastic IP addresses per Region. See [Elastic IP address limit \(p. 1280\)](#) for instructions on increasing the limit.
- **InvalidTransfer.AddressCustomPtrSet:** If you or someone in your organization has configured the Elastic IP address that you are attempting to transfer to use reverse DNS lookup, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must remove the DNS record for the Elastic IP address. For more information, see [Use reverse DNS for email applications \(p. 1278\)](#).
- **InvalidTransfer.AddressAssociated:** If an Elastic IP address is associated with an ENI or EC2 instance, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must disassociate the Elastic IP address. For more information, see [Disassociate an Elastic IP address \(p. 1273\)](#).

For any other exceptions, [contact AWS Support](#).

These steps must be completed by the transfer account.

Console

To accept an Elastic IP address transfer

1. Ensure that you're using the transfer account.

2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Elastic IPs**.
4. Choose **Actions, Accept transfer**.
5. No tags that are associated with the Elastic IP address being transferred are transferred with the Elastic IP address when you accept the transfer. If you want to define a **Name** tag for the Elastic IP address that you are accepting, select **Create a tag with a key of 'Name' and a value that you specify**.
6. Enter the Elastic IP address that you want to transfer.
7. If you are accepting multiple transferred Elastic IP addresses, choose **Add address** to enter an additional Elastic IP address.
8. Choose **Submit**.

AWS CLI

To accept an Elastic IP address transfer

Use the [accept-address-transfer](#) command.

PowerShell

To accept an Elastic IP address transfer

Use the [Approve-EC2AddressTransfer](#) command.

Release an Elastic IP address

If you no longer need an Elastic IP address, we recommend that you release it using one of the following methods. The address to release must not be currently associated with an AWS resource, such as an EC2 instance, NAT gateway, or Network Load Balancer.

Note

If you contacted AWS support to set up reverse DNS for an Elastic IP (EIP) address, you can remove the reverse DNS, but you can't release the Elastic IP address because it's been locked by AWS support. To unlock the Elastic IP address, contact [AWS Support](#). Once the Elastic IP address is unlocked, you can release the Elastic IP address.

Console

To release an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to release and choose **Actions, Release Elastic IP addresses**.
4. Choose **Release**.

AWS CLI

To release an Elastic IP address

Use the [release-address](#) AWS CLI command.

PowerShell

To release an Elastic IP address

Use the [Remove-EC2Address](#) AWS Tools for Windows PowerShell command.

Recover an Elastic IP address

If you have released your Elastic IP address, you might be able to recover it. The following rules apply:

- You cannot recover an Elastic IP address if it has been allocated to another AWS account, or if it will result in exceeding your Elastic IP address limit.
- You cannot recover tags associated with an Elastic IP address.
- You can recover an Elastic IP address using the Amazon EC2 API or a command line tool only.

AWS CLI

To recover an Elastic IP address

Use the [allocate-address](#) AWS CLI command and specify the IP address using the --address parameter as follows.

```
aws ec2 allocate-address --domain vpc --address 203.0.113.3
```

PowerShell

To recover an Elastic IP address

Use the [New-EC2Address](#) AWS Tools for Windows PowerShell command and specify the IP address using the -Address parameter as follows.

```
PS C:\> New-EC2Address -Address 203.0.113.3 -Domain vpc -Region us-east-1
```

Use reverse DNS for email applications

If you intend to send email to third parties from an instance, we recommend that you provision one or more Elastic IP addresses and assign static reverse DNS records to the Elastic IP addresses that you use to send email. This can help you avoid having your email flagged as spam by some anti-spam organizations. AWS works with ISPs and internet anti-spam organizations to reduce the chance that your email sent from these addresses will be flagged as spam.

Considerations

- Before you create a reverse DNS record, you must set a corresponding forward DNS record (record type A) that points to your Elastic IP address.
- If a reverse DNS record is associated with an Elastic IP address, the Elastic IP address is locked to your account and cannot be released from your account until the record is removed.
- **AWS GovCloud (US) Region**

You can't create a reverse DNS record using the console or AWS CLI. AWS must assign the static reverse DNS records for you. Open [Request to remove reverse DNS and email sending limitations](#) and provide us with your Elastic IP addresses and reverse DNS records.

Create a reverse DNS record

To create a reverse DNS record, choose the tab that matches your preferred method.

Console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.
4. For **Reverse DNS domain name**, enter the domain name.
5. Enter **update** to confirm.
6. Choose **Update**.

AWS CLI

Use the [**modify-address-attribute**](#) command in the AWS CLI, as shown in the following example:

```
aws ec2 modify-address-attribute --allocation-id eipalloc-abcdef01234567890 --domain-name example.com
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.net."
            "PtrRecordUpdate": {
                "Value": "example.com.",
                "Status": "PENDING"
            }
        }
    ]
}
```

Remove a reverse DNS record

To remove a reverse DNS record, choose the tab that matches your preferred method.

Console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.
4. For **Reverse DNS domain name**, clear the domain name.
5. Enter **update** to confirm.
6. Choose **Update**.

AWS CLI

Use the [**reset-address-attribute**](#) command in the AWS CLI, as shown in the following example:

```
aws ec2 reset-address-attribute --allocation-id eipalloc-abcdef01234567890 --
attribute domain-name
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com."
            "PtrRecordUpdate": {
                "Value": "example.net.",
                "Status": "PENDING"
            }
        }
    ]
}
```

Note

If you receive the following error when you run the command, you can submit a [Request to remove email sending limitations](#) to customer support for assistance.

The address with allocation id cannot be released because it is locked to your account.

Elastic IP address limit

By default, all AWS accounts are limited to five (5) Elastic IP addresses per Region, because public (IPv4) internet addresses are a scarce public resource. We strongly encourage you to use an Elastic IP address primarily for the ability to remap the address to another instance in the case of instance failure, and to use [DNS hostnames](#) for all other inter-node communication.

To verify how many Elastic IP addresses are in use

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/> and choose **Elastic IPs** from the navigation pane.

To verify your current account limit for Elastic IP addresses

You can verify your limit in either the Amazon EC2 console or the Service Quotas console. Do one of the following:

- Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

Choose **Limits** from the navigation pane, and then enter **IP** in the search field. The limit is **EC2-VPC Elastic IPs**.

- Open the Service Quotas console at <https://console.aws.amazon.com/servicequotas/>.

On the Dashboard, choose **Amazon Elastic Compute Cloud (Amazon EC2)**. If Amazon Elastic Compute Cloud (Amazon EC2) is not listed on the Dashboard, choose **AWS services**, enter **EC2** in the search field, and then choose **Amazon Elastic Compute Cloud (Amazon EC2)**.

On the Amazon EC2 service quotas page, enter **IP** in the search field. The limit is **EC2-VPC Elastic IPs**. For more information, choose the limit.

If you think your architecture warrants additional Elastic IP addresses, you can request a quota increase directly from the Service Quotas console.

Elastic network interfaces

An *elastic network interface* is a logical networking component in a VPC that represents a virtual network card. It can include the following attributes:

- A primary private IPv4 address from the IPv4 address range of your VPC
- One or more secondary private IPv4 addresses from the IPv4 address range of your VPC
- One Elastic IP address (IPv4) per private IPv4 address
- One public IPv4 address
- One or more IPv6 addresses
- One or more security groups
- A MAC address

- A source/destination check flag
- A description

You can create and configure network interfaces and attach them to instances in the same Availability Zone. Your account might also have *requester-managed* network interfaces, which are created and managed by AWS services to enable you to use other resources and services. You cannot manage these network interfaces yourself. For more information, see [Requester-managed network interfaces \(p. 1312\)](#).

This AWS resource is referred to as a *network interface* in the AWS Management Console and the Amazon EC2 API. Therefore, we use "network interface" in this documentation instead of "elastic network interface". The term "network interface" in this documentation always means "elastic network interface".

Contents

- [Network interface basics \(p. 1281\)](#)
- [IP addresses per network interface per instance type \(p. 1282\)](#)
- [Work with network interfaces \(p. 1301\)](#)
- [Best practices for configuring network interfaces \(p. 1309\)](#)
- [Scenarios for network interfaces \(p. 1310\)](#)
- [Requester-managed network interfaces \(p. 1312\)](#)
- [Assign prefixes to Amazon EC2 network interfaces \(p. 1313\)](#)

Network interface basics

You can create a network interface, attach it to an instance, detach it from an instance, and attach it to another instance. The attributes of a network interface follow it as it's attached or detached from an instance and reattached to another instance. When you move a network interface from one instance to another, network traffic is redirected to the new instance.

Primary network interface

Each instance has a default network interface, called the *primary network interface*. You cannot detach a primary network interface from an instance. You can create and attach additional network interfaces. The maximum number of network interfaces that you can use varies by instance type. For more information, see [IP addresses per network interface per instance type \(p. 1282\)](#).

Public IPv4 addresses for network interfaces

In a VPC, all subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are assigned a public IPv4 address. For more information, see [Subnet settings](#) in the *Amazon VPC User Guide*. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses. When you launch an instance, the IP address is assigned to the primary network interface that's created.

When you create a network interface, it inherits the public IPv4 addressing attribute from the subnet. If you later modify the public IPv4 addressing attribute of the subnet, the network interface keeps the setting that was in effect when it was created. If you launch an instance and specify an existing network interface as the primary network interface, the public IPv4 address attribute is determined by this network interface.

For more information, see [Public IPv4 addresses \(p. 1236\)](#).

Elastic IP addresses for network interface

If you have an Elastic IP address, you can associate it with one of the private IPv4 addresses for the network interface. You can associate one Elastic IP address with each private IPv4 address.

If you disassociate an Elastic IP address from a network interface, you can release it back to the address pool. This is the only way to associate an Elastic IP address with an instance in a different subnet or VPC, as network interfaces are specific to subnets.

IPv6 addresses for network interfaces

If you associate IPv6 CIDR blocks with your VPC and subnet, you can assign one or more IPv6 addresses from the subnet range to a network interface. Each IPv6 address can be assigned to one network interface.

All subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are automatically assigned an IPv6 address from the range of the subnet. For more information, see [Subnet settings](#) in the *Amazon VPC User Guide*. When you launch an instance, the IPv6 address is assigned to the primary network interface that's created.

For more information, see [IPv6 addresses \(p. 1237\)](#).

Prefix Delegation

A Prefix Delegation prefix is a reserved private IPv4 or IPv6 CIDR range that you allocate for automatic or manual assignment to network interfaces that are associated with an instance. By using Delegated Prefixes, you can launch services faster by assigning a range of IP addresses as a single prefix.

Termination behavior

You can set the termination behavior for a network interface that's attached to an instance. You can specify whether the network interface should be automatically deleted when you terminate the instance to which it's attached.

Source/destination checking

You can enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. Source/destination checks are enabled by default. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

Monitoring IP traffic

You can enable a VPC flow log on your network interface to capture information about the IP traffic going to and from a network interface. After you've created a flow log, you can view and retrieve its data in Amazon CloudWatch Logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

IP addresses per network interface per instance type

The following tables list the maximum number of network interfaces per instance type, and the maximum number of private IPv4 addresses and IPv6 addresses per network interface. The limit for IPv6 addresses is separate from the limit for private IPv4 addresses per network interface. Not all instance types support IPv6 addressing.

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type, such as the supported network interfaces and IP addresses per interface. The following example displays this information for all C5 instances.

```
aws ec2 describe-instance-types --filters "Name=instance-type,Values=c5.*" --query "InstanceTypes[].{Type: InstanceType, MaxENI: NetworkInfo.MaximumNetworkInterfaces, IPv4addr: NetworkInfo.Ipv4AddressesPerInterface}" --output table
-----
|           DescribeInstanceTypes           |
+-----+-----+-----+
| IPv4addr | MaxENI |     Type      |
+-----+-----+-----+
|   30    |    8   | c5.4xlarge  |
|   50    |   15   | c5.24xlarge |
|   15    |    4   | c5.xlarge   |
|   30    |    8   | c5.12xlarge |
|   10    |    3   | c5.large    |
|   15    |    4   | c5.2xlarge  |
|   50    |   15   | c5.metal    |
|   30    |    8   | c5.9xlarge  |
|   50    |   15   | c5.18xlarge |
+-----+-----+-----+
```

Work with network interfaces

You can work with network interfaces using the Amazon EC2 console or the command line.

Contents

- [Create a network interface \(p. 1301\)](#)
- [View details about a network interface \(p. 1303\)](#)
- [Attach a network interface to an instance \(p. 1304\)](#)
- [Detach a network interface from an instance \(p. 1304\)](#)
- [Manage IP addresses \(p. 1305\)](#)
- [Modify network interface attributes \(p. 1307\)](#)
- [Add or edit tags \(p. 1308\)](#)
- [Delete a network interface \(p. 1309\)](#)

Create a network interface

You can create a network interface in a subnet. You can't move the network interface to another subnet after it's created. You must attach a network interface to an instance in the same Availability Zone.

New console

To create a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create network interface**.
4. (Optional) For **Description**, enter a descriptive name.
5. For **Subnet**, select a subnet. The options available in the subsequent steps change depending on the type of subnet you select (IPv4-only, IPv6-only, or dual-stack (IPv4 and IPv6)).

6. For **Private IPv4 address**, do one of the following:
 - Choose **Auto-assign** to allow Amazon EC2 to select an IPv4 address from the subnet.
 - Choose **Custom** and enter an IPv4 address that you select from the subnet.
7. (Subnets with IPv6 addresses only) For **IPv6 address**, do one of the following:
 - Choose **None** if you do not want to assign an IPv6 address to the network interface.
 - Choose **Auto-assign** to allow Amazon EC2 to select an IPv6 address from the subnet.
 - Choose **Custom** and enter an IPv6 address that you select from the subnet.
8. (Optional) If you're creating a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.
9. (Optional) To create an Elastic Fabric Adapter, choose **Elastic Fabric Adapter, Enable**.
10. For **Security groups**, select one or more security groups.
11. (Optional) If you're creating a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. Choose **Enable** if you want AWS to automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address.

Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if this instance that this ENI is attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. Traffic will be routed to the primary IPv6 address until the instance is terminated or the ENI associated with the instance is detached from the instance. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.
12. (Optional) For each tag, choose **Add new tag** and enter a tag key and an optional tag value.
13. Choose **Create network interface**.

Old console

To create a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create Network Interface**.
4. For **Description**, enter a descriptive name.
5. For **Subnet**, select the subnet.
6. For **Private IP (or IPv4 Private IP)**, enter the primary private IPv4 address. If you don't specify an IPv4 address, we select an available private IPv4 address from within the selected subnet.
7. (IPv6 only) If you selected a subnet that has an associated IPv6 CIDR block, you can optionally specify an IPv6 address in the **IPv6 IP** field.
8. To create an Elastic Fabric Adapter, select **Elastic Fabric Adapter**.

9. For **Security groups**, select one or more security groups.
10. (Optional) Choose **Add Tag** and enter a tag key and a tag value.
11. Choose **Yes, Create**.

To create a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [create-network-interface](#) (AWS CLI)
- [New-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

View details about a network interface

You can view all the network interfaces in your account.

New console

To describe a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. To view the details page for a network interface, select the ID of the network interface. Alternatively, to view information without leaving the network interfaces page, select the checkbox for the network interface.

Old console

To describe a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. To view the details, choose **Details**.

To describe a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [describe-network-interfaces](#) (AWS CLI)
- [Get-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

To describe a network interface attribute using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [describe-network-interface-attribute](#) (AWS CLI)
- [Get-EC2NetworkInterfaceAttribute](#) (AWS Tools for Windows PowerShell)

Attach a network interface to an instance

You can attach a network interface to any instance in the same Availability Zone as the network interface, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console. Alternatively, you can specify existing network interfaces when you [launch instances \(p. 552\)](#).

Important

For EC2 instances in an IPv6-only subnet, if you attach a secondary network interface to the instance, the private DNS hostname of the second network interface will resolve to the first IPv6 address on the instance's first network interface. For more information about EC2 instance private DNS hostnames, see [Amazon EC2 instance hostname types \(p. 1250\)](#).

If the public IPv4 address on your instance is released, it does not receive a new one if there is more than one network interface attached to the instance. For more information about the behavior of public IPv4 addresses, see [Public IPv4 addresses \(p. 1236\)](#).

Instances page

To attach a network interface to an instance using the Instances page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance.
4. Choose **Actions, Networking, Attach network interface**.
5. Select a network interface. If the instance supports multiple network cards, you can choose a network card.
6. Choose **Attach**.

Network Interfaces page

To attach a network interface to an instance using the Network Interfaces page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Attach**.
5. Choose an instance. If the instance supports multiple network cards, you can choose a network card.
6. Choose **Attach**.

To attach a network interface to an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [attach-network-interface](#) (AWS CLI)
- [Add-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Detach a network interface from an instance

You can detach a secondary network interface that is attached to an EC2 instance at any time, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console.

If you try to detach a network interface that is attached to a resource from another service, such as an Elastic Load Balancing load balancer, a Lambda function, a WorkSpace, or a NAT gateway, you get an error that you do not have permission to access the resource. To find which service created the resource attached to a network interface, check the description of the network interface. If you delete the resource, then its network interface is deleted.

Instances page

To detach a network interface from an instance using the Instances page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance. Check the **Network interfaces** section of the **Networking** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions, Networking, Detach network interface**.
5. Select the network interface and choose **Detach**.

Network Interfaces page

To detach a network interface from an instance using the Network Interfaces page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface. Check the **Instance details** section of the **Details** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions, Detach**.
5. When prompted for confirmation, choose **Detach**.
6. If the network interface fails to detach from the instance, choose **Force detachment, Enable** and then try again. We recommend that force detachment only as a last resort. Forcing a detachment can prevent you from attaching a different network interface on the same index until you restart the instance. It can also prevent the instance metadata from reflecting that the network interface was detached until you restart the instance.

To detach a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [detach-network-interface](#) (AWS CLI)
- [Dismount-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Manage IP addresses

You can manage the following IP addresses for your network interfaces:

- Elastic IP addresses (one per private IPv4 address)
- IPv4 addresses
- IPv6 addresses
- Primary IPv6 address

To manage the Elastic IP addresses of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. To associate an Elastic IP address, do the following:
 - a. Choose **Actions, Associate address**.
 - b. For **Elastic IP address**, select the Elastic IP address.
 - c. For **Private IPv4 address**, select the private IPv4 address to associate with the Elastic IP address.
 - d. (Optional) Choose **Allow the Elastic IP address to be reassociated** if the network interface is currently associated with another instance or network interface.
 - e. Choose **Associate**.
5. To disassociate an Elastic IP address, do the following:
 - a. Choose **Actions, Disassociate address**.
 - b. For **Public IP address**, select the Elastic IP address.
 - c. Choose **Disassociate**.

To manage the IPv4 and IPv6 addresses of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. Choose **Actions, Manage IP addresses**.
5. Expand the network interface.
6. For **IPv4 addresses**, modify the IP addresses as needed. To assign an IPv4 address, choose **Assign new IP address** and then specify an IPv4 address from the subnet range or let AWS choose one for you. To unassign an IPv4 address, choose **Unassign** next to the address.
7. For **IPv6 addresses**, modify the IP addresses as needed. To assign an IPv6 address, choose **Assign new IP address** and then specify an IPv6 address from the subnet range or let AWS choose one for you. To unassign an IPv6 address, choose **Unassign** next to the address.
8. (Optional) If your modifying a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.
9. Choose **Save**.

To manage the IP addresses of a network interface using the AWS CLI

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [assign-ipv6-addresses](#)
- [associate-address](#)

- [disassociate-address](#)
- [unassign-ipv6-addresses](#)

To manage the IP addresses of a network interface using the Tools for Windows PowerShell

You can use one of the following commands.

- [Register-EC2Address](#)
- [Register-EC2Ipv6AddressList](#)
- [Unregister-EC2Address](#)
- [Unregister-EC2Ipv6AddressList](#)

Modify network interface attributes

You can change the following network interface attributes:

- [Description \(p. 1307\)](#)
- [Security groups \(p. 1307\)](#)
- [Delete on termination \(p. 1307\)](#)
- [Source/destination check \(p. 1308\)](#)

To change the description of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change description**.
5. For **Description**, enter a description for the network interface.
6. Choose **Save**.

To change the security groups of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change security groups**.
5. For **Associated security groups**, select the security groups to use, and then choose **Save**.

The security group and network interface must be created for the same VPC. To change the security group for interfaces owned by other services, such as Elastic Load Balancing, do so through that service.

To change the termination behavior of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change termination behavior**.
5. Select or clear **Delete on termination, Enable** as needed, and then choose **Save**.

To change source/destination checking for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change source/dest check**.
5. Select or clear **Source/destination check, Enable** as needed, and then choose **Save**.

To modify network interface attributes using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [modify-network-interface-attribute](#) (AWS CLI)
- [Edit-EC2NetworkInterfaceAttribute](#) (AWS Tools for Windows PowerShell)

Add or edit tags

Tags are metadata that you can add to a network interface. Tags are private and are only visible to your account. Each tag consists of a key and an optional value. For more information about tags, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

New console

To add or edit tags for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. In **Tags** tab, choose **Manage tags**.
5. For each tag to create, choose **Add new tag** and enter a key and optional value. When you're done, choose **Save**.

Old console

To add or edit tags for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. In the details pane, choose **Tags, Add/Edit Tags**.
5. In the **Add/Edit Tags** dialog box, choose **Create Tag** for each tag to create, and enter a key and optional value. When you're done, choose **Save**.

To add or edit tags for a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [create-tags](#) (AWS CLI)
- [New-EC2Tag](#) (AWS Tools for Windows PowerShell)

Delete a network interface

Deleting a network interface releases all attributes associated with the interface and releases any private IP addresses or Elastic IP addresses to be used by another instance.

You cannot delete a network interface that is in use. First, you must [detach the network interface \(p. 1304\)](#).

New console

To delete a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface, and then choose **Actions, Delete**.
4. When prompted for confirmation, choose **Delete**.

Old console

To delete a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select a network interface and choose **Delete**.
4. In the **Delete Network Interface** dialog box, choose **Yes, Delete**.

To delete a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [delete-network-interface](#) (AWS CLI)
- [Remove-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Best practices for configuring network interfaces

- You can attach a network interface to an instance when it's running (hot attach), when it's stopped (warm attach), or when the instance is being launched (cold attach).
- You can detach secondary network interfaces when the instance is running or stopped. However, you can't detach the primary network interface.
- You can move a network interface from one instance to another, if the instances are in the same Availability Zone and VPC but in different subnets.
- When launching an instance using the CLI, API, or an SDK, you can specify the primary network interface and additional network interfaces.

- Launching an Amazon Linux or Windows Server instance with multiple network interfaces automatically configures interfaces, private IPv4 addresses, and route tables on the operating system of the instance.
- A warm or hot attach of an additional network interface might require you to manually bring up the second interface, configure the private IPv4 address, and modify the route table accordingly. Instances running Amazon Linux or Windows Server automatically recognize the warm or hot attach and configure themselves.
- You cannot attach another network interface to an instance (for example, a NIC teaming configuration) to increase or double the network bandwidth to or from the dual-homed instance.
- If you attach two or more network interfaces from the same subnet to an instance, you might encounter networking issues such as asymmetric routing. If possible, use a secondary private IPv4 address on the primary network interface instead. If you need to use multiple network interfaces, you must configure the network interfaces to use static routing.

Scenarios for network interfaces

Attaching multiple network interfaces to an instance is useful when you want to:

- Create a management network.
- Use network and security appliances in your Virtual Private Cloud (VPC).
- Create dual-homed instances with workloads/roles on distinct subnets.
- Create a low-budget, high-availability solution.

Create a management network

This scenario describes how you can create a management network with network interfaces, given the following criteria and settings (image follows).

Criteria

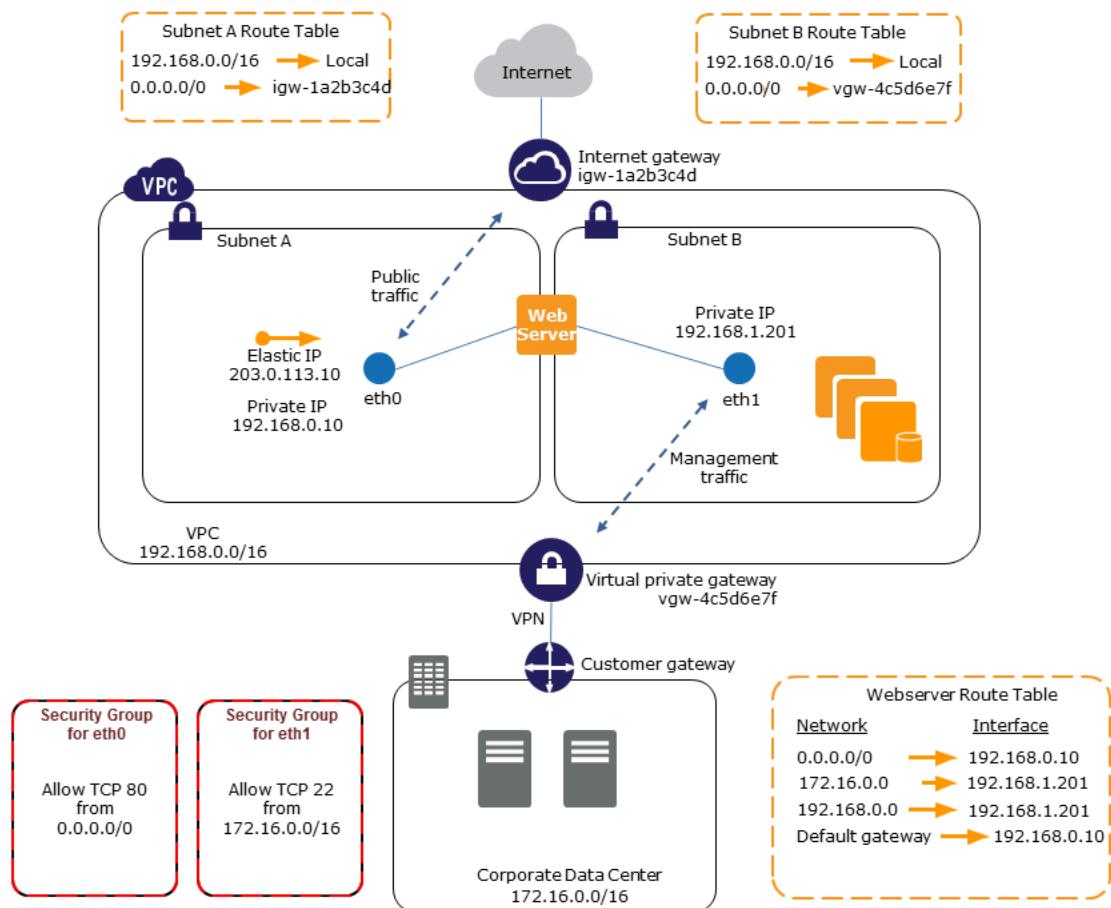

- The primary network interface on the instance (*eth0*) handles public traffic.
- The secondary network interface on the instance (*eth1*) handles backend management traffic. It's connected to a separate subnet that has more restrictive access controls, and is located within the same Availability Zone (AZ) as the primary network interface.

Settings

- The primary network interface, which may or may not be behind a load balancer, has an associated security group that allows access to the server from the internet. For example, allow TCP port 80 and 443 from *0.0.0.0/0* or from the load balancer.
- The secondary network interface has an associated security group that allows RDP access only, initiated from one of the following locations:
 - An allowed range of IP addresses, either within the VPC, or from the internet.
 - A private subnet within the same AZ as the primary network interface.
 - A virtual private gateway.

Note

To ensure failover capabilities, consider using a secondary private IPv4 for incoming traffic on a network interface. In the event of an instance failure, you can move the interface and/or secondary private IPv4 address to a standby instance.

Use network and security appliances in your VPC

Some network and security appliances, such as load balancers, network address translation (NAT) servers, and proxy servers prefer to be configured with multiple network interfaces. You can create and attach secondary network interfaces to instances that are running these types of applications and configure the additional interfaces with their own public and private IP addresses, security groups, and source/destination checking.

Creating dual-homed instances with workloads/roles on distinct subnets

You can place a network interface on each of your web servers that connects to a mid-tier network where an application server resides. The application server can also be dual-homed to a backend network (subnet) where the database server resides. Instead of routing network packets through the dual-homed instances, each dual-homed instance receives and processes requests on the front end, initiates a connection to the backend, and then sends requests to the servers on the backend network.

Create a low budget high availability solution

If one of your instances serving a particular function fails, its network interface can be attached to a replacement or hot standby instance pre-configured for the same role in order to rapidly recover the service. For example, you can use a network interface as your primary or secondary network interface to

a critical service such as a database instance or a NAT instance. If the instance fails, you (or more likely, the code running on your behalf) can attach the network interface to a hot standby instance. Because the interface maintains its private IP addresses, Elastic IP addresses, and MAC address, network traffic begins flowing to the standby instance as soon as you attach the network interface to the replacement instance. Users experience a brief loss of connectivity between the time the instance fails and the time that the network interface is attached to the standby instance, but no changes to the route table or your DNS server are required.

Requester-managed network interfaces

A requester-managed network interface is a network interface that an AWS service creates in your VPC on your behalf. The network interface is associated with a resource for another service, such as a DB instance from Amazon RDS, a NAT gateway, or an interface VPC endpoint from AWS PrivateLink.

Considerations

- You can view the requester-managed network interfaces in your account. You can add or remove tags, but you can't change other properties of a requester-managed network interface.
- You can't detach a requester-managed network interface.
- When you delete the resource associated with a requester-managed network interface, the AWS service detaches the network interface and deletes it. If the service detached a network interface but didn't delete it, you can delete the detached network interface.

To view requester-managed network interfaces using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network & Security, Network Interfaces**.
3. Select the ID of the network interface to open its details page.
4. The following are the key fields that you can use to determine the purpose of the network interface:
 - **Description:** A description provided by the AWS service that created the interface. For example, "VPC Endpoint Interface vpce-089f2123488812123".
 - **Requester-managed:** Indicates whether the network interface is managed by AWS.
 - **Requester ID:** The alias or AWS account ID of the principal or service that created the network interface. If you created the network interface, this is your AWS account ID. Otherwise, another principal or service created it.

To view requester-managed network interfaces using the AWS CLI

Use the [describe-network-interfaces](#) command as follows.

```
aws ec2 describe-network-interfaces --filters Name=requester-managed,Values=true
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: **Description** and **InterfaceType**.

```
{  
  ...  
  "Description": "VPC Endpoint Interface vpce-089f2123488812123",  
  ...  
  "InterfaceType": "vpc_endpoint",  
  ...  
  "NetworkInterfaceId": "eni-0d11e3cccd2c0e6c57",  
  ...  
}
```

```
...  
"RequesterId": "727180483921",  
"RequesterManaged": true,  
...  
}
```

To view requester-managed network interfaces using the Tools for Windows PowerShell

Use the [Get-EC2NetworkInterface](#) cmdlet as follows.

```
Get-EC2NetworkInterface -Filter @{ Name="requester-managed"; Values="true" }
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: `Description` and `InterfaceType`.

```
Description      : VPC Endpoint Interface vpce-089f2123488812123  
...  
InterfaceType   : vpc_endpoint  
...  
NetworkInterfaceId : eni-0d11e3ccd2c0e6c57  
...  
RequesterId     : 727180483921  
RequesterManaged : True  
...
```

Assign prefixes to Amazon EC2 network interfaces

You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces. By assigning prefixes, you scale and simplify the management of applications, including container and networking applications that require multiple IP addresses on an instance.

The following assignment options are available:

- **Automatic assignment** — AWS chooses the prefix from your VPC subnet's IPv4 or IPv6 CIDR block and assigns it to your network interface.
- **Manual Assignment** — You specify the prefix from your VPC subnet's IPv4 or IPv6 CIDR block, and AWS verifies that the prefix is not already assigned to other resources before assigning it to your network interface.

Assigning prefixes has the following benefits:

- **Increased IP addresses on a network interface** — When you use a prefix, you assign a block of IP addresses as opposed to individual IP addresses. This increases the number of IP addresses for a network interface.
- **Simplified VPC management for containers** — In container applications, each container requires a unique IP address. Assigning prefixes to your instance simplifies the management of your VPCs, as you can launch and terminate containers without having to call Amazon EC2 APIs for individual IP assignments.

Contents

- [Basics for assigning prefixes \(p. 1314\)](#)
- [Considerations and limits for prefixes \(p. 1314\)](#)
- [Work with prefixes \(p. 1314\)](#)

Basics for assigning prefixes

- You can assign a prefix to new or existing network interfaces.
- To use prefixes, you assign a prefix to your network interface, attach the network interface to your instance, and then configure your operating system.
- When you choose the option to specify a prefix, the prefix must meet the following requirements:
 - The IPv4 prefix that you can specify is /28.
 - The IPv6 prefix that you can specify is /80.
 - The prefix is in the subnet CIDR of the network interface, and does not overlap with other prefixes or IP addresses assigned to existing resources in the subnet.
- You can assign a prefix to the primary or secondary network interface.
- You can assign an Elastic IP address to a network interface that has a prefix assigned to it.
- You can also assign an Elastic IP address to the IP address part of the assigned prefix.
- We resolve the private DNS host name of an instance to the primary private IPv4 address.
- We assign each private IPv4 address for a network interface, including those from prefixes, using the following format:
 - us-east-1 Region

ip-private-ipv4-address.ec2.internal

- All other Regions

ip-private-ipv4-address.region.compute.internal

Considerations and limits for prefixes

Take the following into consideration when you use prefixes:

- Network interfaces with prefixes are supported with [instances built on the Nitro System \(p. 218\)](#).
- Prefixes for network interfaces are limited to IPv6 addresses and private IPv4 addresses.
- The maximum number of IP addresses that you can assign to a network interface depends on the instance type. Each prefix that you assign to a network interface counts as one IP address. For example, a c5.large instance has a limit of 10 IPv4 addresses per network interface. Each network interface for this instance has a primary IPv4 address. If a network interface has no secondary IPv4 addresses, you can assign up to 9 prefixes to the network interface. For each additional IPv4 address that you assign to a network interface, you can assign one less prefix to the network interface. For more information, see [IP addresses per network interface per instance type \(p. 128\)](#).
- Prefixes are included in source/destination checks.

Work with prefixes

You can use prefixes with your network interfaces as follows.

Tasks

- [Assign prefixes during network interface creation \(p. 1315\)](#)
- [Assign prefixes to existing network interfaces \(p. 1319\)](#)
- [Configure your operating system for network interfaces with prefixes \(p. 1321\)](#)
- [View the prefixes assigned to your network interfaces \(p. 1322\)](#)
- [Remove prefixes from your network interfaces \(p. 1323\)](#)

Assign prefixes during network interface creation

If you use the automatic assignment option, you can reserve a block of IP addresses in your subnet. AWS chooses the prefixes from this block. For more information, see [Subnet CIDR reservations](#) in the *Amazon VPC User Guide*.

After you have created the network interface, use the [attach-network-interface](#) AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see [Configure your operating system for network interfaces with prefixes \(p. 1321\)](#).

Tasks

- [Assign automatic prefixes during network interface creation \(p. 1315\)](#)
- [Assign specific prefixes during network interface creation \(p. 1317\)](#)

Assign automatic prefixes during network interface creation

You can assign automatic prefixes during network interface creation using one of the following methods.

Console

To assign automatic prefixes during network interface creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand **Advanced settings** and do the following:
 - a. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.
 - b. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.
6. Choose **Create network interface**.

AWS CLI

To assign automatic IPv4 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
C:\> aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv4 automatic example" \
--ipv4-prefix-count 1
```

Example output

```
{
```

```
"NetworkInterface": {  
    "AvailabilityZone": "us-west-2a",  
    "Description": "IPv4 automatic example",  
    "Groups": [  
        {  
            "GroupName": "default",  
            "GroupId": "sg-044c2de2c4EXAMPLE"  
        }  
    ],  
    "InterfaceType": "interface",  
    "Ipv6Addresses": [],  
    "MacAddress": "02:98:65:dd:18:47",  
    "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",  
    "OwnerId": "123456789012",  
    "PrivateIpAddress": "10.0.0.62",  
    "PrivateIpAddresses": [  
        {  
            "Primary": true,  
            "PrivateIpAddress": "10.0.0.62"  
        }  
    ],  
    "Ipv4Prefixes": [  
        {  
            "Ipv4Prefix": "10.0.0.208/28"  
        }  
    ],  
    "RequesterId": "AIDAI5AJI5LXF5XXDPCO",  
    "RequesterManaged": false,  
    "SourceDestCheck": true,  
    "Status": "pending",  
    "SubnetId": "subnet-047cfed18eEXAMPLE",  
    "TagSet": [],  
    "VpcId": "vpc-0e12f52b21EXAMPLE"  
}  
}
```

To assign automatic IPv6 prefixes during network interface creation

Use the [create-network-interface](#) command and set --ipv6-prefix-count to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
C:\> aws ec2 create-network-interface \  
--subnet-id subnet-047cfed18eEXAMPLE \  
--description "IPv6 automatic example" \  
--ipv6-prefix-count 1
```

Example output

```
{  
    "NetworkInterface": {  
        "AvailabilityZone": "us-west-2a",  
        "Description": "IPv6 automatic example",  
        "Groups": [  
            {  
                "GroupName": "default",  
                "GroupId": "sg-044c2de2c4EXAMPLE"  
            }  
        ],  
        "InterfaceType": "interface",  
        "Ipv6Addresses": [],  
        "MacAddress": "02:bb:e4:31:fe:09",  
        "NetworkInterfaceId": "eni-006edbca4EXAMPLE",  
        "OwnerId": "123456789012",  
        "PrivateIpAddress": "10.0.0.62",  
        "PrivateIpAddresses": [  
            {  
                "Primary": true,  
                "PrivateIpAddress": "10.0.0.62"  
            }  
        ],  
        "Ipv4Prefixes": [  
            {  
                "Ipv4Prefix": "10.0.0.208/28"  
            }  
        ]  
    }  
}
```

```
"PrivateIpAddress": "10.0.0.73",
"PrivateIpAddresses": [
    {
        "Primary": true,
        "PrivateIpAddress": "10.0.0.73"
    }
],
"Ipv6Prefixes": [
    {
        "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
    }
],
"RequesterId": "AIDAI5AJI5LXF5XXDPCO",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-047cfed18eEXAMPLE",
"TagSet": [],
"VpcId": "vpc-0e12f52b21EXAMPLE"
}
```

Assign specific prefixes during network interface creation

You can assign specific prefixes during network interface creation using one of the following methods.

Console

To assign specific prefixes during network interface creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand **Advanced settings** and do the following:
 - a. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.
 - b. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.
6. Choose **Create network interface**.

AWS CLI

To assign specific IPv4 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv4-prefixes` to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is `10.0.0.208/28`.

```
C:\> aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv4 manual example" \
--ipv4-prefixes Ipv4Prefix=10.0.0.208/28
```

Example output

```
{  
    "NetworkInterface": {  
        "AvailabilityZone": "us-west-2a",  
        "Description": "IPv4 manual example",  
        "Groups": [  
            {  
                "GroupName": "default",  
                "GroupId": "sg-044c2de2c4EXAMPLE"  
            }  
        ],  
        "InterfaceType": "interface",  
        "Ipv6Addresses": [],  
        "MacAddress": "02:98:65:dd:18:47",  
        "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",  
        "OwnerId": "123456789012",  
        "PrivateIpAddress": "10.0.0.62",  
        "PrivateIpAddresses": [  
            {  
                "Primary": true,  
                "PrivateIpAddress": "10.0.0.62"  
            }  
        ],  
        "Ipv4Prefixes": [  
            {  
                "Ipv4Prefix": "10.0.0.208/28"  
            }  
        ],  
        "RequesterId": "AIDAI5AJI5LXF5XXDPC0",  
        "RequesterManaged": false,  
        "SourceDestCheck": true,  
        "Status": "pending",  
        "SubnetId": "subnet-047cfed18eEXAMPLE",  
        "TagSet": [],  
        "VpcId": "vpc-0e12f52b21EXAMPLE"  
    }  
}
```

To assign specific IPv6 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv6-prefixes` to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is `2600:1f13:fc2:a700:1768::/80`.

```
C:\> aws ec2 create-network-interface \  
    --subnet-id subnet-047cfed18eEXAMPLE \  
    --description "IPv6 manual example" \  
    --ipv6-prefixes Ipv6Prefix=2600:1f13:fc2:a700:1768::/80
```

Example output

```
{  
    "NetworkInterface": {  
        "AvailabilityZone": "us-west-2a",  
        "Description": "IPv6 automatic example",  
        "Groups": [  
            {  
                "GroupName": "default",  
                "GroupId": "sg-044c2de2c4EXAMPLE"  
            }  
        ],  
    }  
}
```

```
"InterfaceType": "interface",
"Ipv6Addresses": [],
"MacAddress": "02:bb:e4:31:fe:09",
"NetworkInterfaceId": "eni-006edbcfa4EXAMPLE",
"OwnerId": "123456789012",
"PrivateIpAddress": "10.0.0.73",
"PrivateIpAddresses": [
    {
        "Primary": true,
        "PrivateIpAddress": "10.0.0.73"
    }
],
"Ipv6Prefixes": [
    {
        "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
    }
],
"RequesterId": "AIDAI5AJI5LXF5XXDPC0",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-047cfed18eEXAMPLE",
"TagSet": [],
"VpcId": "vpc-0e12f52b21EXAMPLE"
}
```

Assign prefixes to existing network interfaces

After you have assigned the prefixes, use the [attach-network-interface](#) AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see [Configure your operating system for network interfaces with prefixes \(p. 1321\)](#).

Tasks

- [Assign automatic prefixes to an existing network interface \(p. 1319\)](#)
- [Assign specific prefixes to an existing network interface \(p. 1320\)](#)

Assign automatic prefixes to an existing network interface

You can assign automatic prefixes to an existing network interface using one of the following methods.

Console

To assign automatic prefixes to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions, Manage prefixes**.
4. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.
5. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

You can use the [assign-ipv6-addresses](#) command to assign IPv6 prefixes and the [assign-private-ip-addresses](#) command to assign IPv4 prefixes to existing network interfaces.

To assign automatic IPv4 prefixes to an existing network interface

Use the [assign-private-ip-addresses](#) command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv4 prefix.

```
C:\> aws ec2 assign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefix-count 1
```

Example output

```
{
    "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",
    "AssignedIpv4Prefixes": [
        {
            "Ipv4Prefix": "10.0.0.176/28"
        }
    ]
}
```

To assign automatic IPv6 prefixes to an existing network interface

Use the [assign-ipv6-addresses](#) command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv6 prefix.

```
C:\> aws ec2 assign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefix-count 1
```

Example output

```
{
    "AssignedIpv6Prefixes": [
        "2600:1f13:fc2:a700:18bb::/80"
    ],
    "NetworkInterfaceId": "eni-00d577338cEXAMPLE"
}
```

Assign specific prefixes to an existing network interface

You can assign specific prefixes to an existing network interface using one of the following methods.

Console

To assign specific prefixes to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions**, **Manage prefixes**.
4. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

5. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

Assign specific IPv4 prefixes to an existing network interface

Use the [assign-private-ip-addresses](#) command and set `--ipv4-prefixes` to the prefix. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is `10.0.0.208/28`.

```
C:\> aws ec2 assign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefixes 10.0.0.208/28
```

Example output

```
{  
    "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",  
    "AssignedIpv4Prefixes": [  
        {  
            "Ipv4Prefix": "10.0.0.208/28"  
        }  
    ]  
}
```

Assign specific IPv6 prefixes to an existing network interface

Use the [assign-ipv6-addresses](#) command and set `--ipv6-prefixes` to the prefix. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is `2600:1f13:fc2:a700:18bb::/80`.

```
C:\> aws ec2 assign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefixes 2600:1f13:fc2:a700:18bb::/80
```

Example output

```
{  
    "NetworkInterfaceId": "eni-00d577338cEXAMPLE",  
    "AssignedIpv6Prefixes": [  
        {  
            "Ipv6Prefix": "2600:1f13:fc2:a700:18bb::/80"  
        }  
    ]  
}
```

Configure your operating system for network interfaces with prefixes

Amazon Linux AMIs might contain additional scripts installed by AWS, known as `ec2-net-utils`. These scripts optionally automate the configuration of your network interfaces. They are available for Amazon Linux only.

If you are not using Amazon Linux, you can use a Container Network Interface (CNI) for Kubernetes plug-in, or `dockerd` if you use Docker to manage your containers.

View the prefixes assigned to your network interfaces

You can view the prefixes assigned to your network interfaces using one of the following methods.

Console

To view the automatic prefixes assigned to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface for which to view the prefixes and choose the **Details** tab.
4. The **IPv4 Prefix Delegation** field lists the assigned IPv4 prefixes, and the **IPv6 Prefix Delegation** field lists the assigned IPv6 prefixes.

AWS CLI

You can use the [describe-network-interfaces](#) AWS CLI command to view the prefixes assigned to your network interfaces.

```
C:\> aws ec2 describe-network-interfaces
```

Example output

```
{  
    "NetworkInterfaces": [  
        {  
            "AvailabilityZone": "us-west-2a",  
            "Description": "IPv4 automatic example",  
            "Groups": [  
                {  
                    "GroupName": "default",  
                    "GroupId": "sg-044c2de2c4EXAMPLE"  
                }  
            ],  
            "InterfaceType": "interface",  
            "Ipv6Addresses": [],  
            "MacAddress": "02:98:65:dd:18:47",  
            "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",  
            "OwnerId": "123456789012",  
            "PrivateIpAddress": "10.0.0.62",  
            "PrivateIpAddresses": [  
                {  
                    "Primary": true,  
                    "PrivateIpAddress": "10.0.0.62"  
                }  
            ],  
            "Ipv4Prefixes": [  
                {  
                    "Ipv4Prefix": "10.0.0.208/28"  
                }  
            ],  
            "Ipv6Prefixes": [],  
            "RequesterId": "AIDAI5AJI5LXF5XXDPC0",  
            "RequesterManaged": false,  
            "SourceDestCheck": true,  
            "Status": "available",  
            "SubnetId": "subnet-05eef9fb78EXAMPLE",  
            "TagSet": [],  
            "VpcId": "vpc-0e12f52b2146bf252"  
        },  
    ]  
}
```

```
{  
    "AvailabilityZone": "us-west-2a",  
    "Description": "IPv6 automatic example",  
    "Groups": [  
        {  
            "GroupName": "default",

Remove prefixes from your network interfaces

You can remove prefixes from your network interfaces using one of the following methods.

Console

To remove the prefixes from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface from which to remove the prefixes and choose **Actions**, **Manage prefixes**.
4. Do one of the following:
 - To remove all assigned prefixes, for **IPv4 prefix delegation** and **IPv6 prefix delegation**, choose **Do not assign**.
 - To remove specific assigned prefixes, for **IPv4 prefix delegation** or **IPv6 prefix delegation**, choose **Custom** and then choose **Unassign** next to the prefixes to remove.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Choose **Save**.

AWS CLI

You can use the [unassign-ipv6-addresses](#) command to remove IPv6 prefixes and the [unassign-private-ip-addresses](#) commands to remove IPv4 prefixes from your existing network interfaces.

To remove IPv4 prefixes from a network interface

Use the [unassign-private-ip-addresses](#) command and set `--ipv4-prefix` to the address that you want to remove.

```
C:\> aws ec2 unassign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefixes 10.0.0.176/28
```

To remove IPv6 prefixes from a network interface

Use the [unassign-ipv6-addresses](#) command and set `--ipv6-prefix` to the address that you want to remove.

```
C:\> aws ec2 unassign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefix 2600:1f13:fc2:a700:18bb::/80
```

Amazon EC2 instance network bandwidth

Instance bandwidth specifications apply to both inbound and outbound traffic for the instance. For example, if an instance specifies up to 10 Gbps of bandwidth, that means it has up to 10 Gbps of bandwidth for inbound traffic, and up to 10 Gbps for outbound traffic. The network bandwidth that's available to an EC2 instance depends on several factors, as follows.

Multi-flow traffic

Bandwidth for aggregate multi-flow traffic available to an instance depends on the destination of the traffic.

- Within the Region – Traffic can utilize the full network bandwidth available to the instance.
- To other Regions, an internet gateway, Direct Connect, or local gateways (LGW) – Traffic can utilize up to 50% of the network bandwidth available to a [current generation instance \(p. 212\)](#) with a minimum of 32 vCPUs. Bandwidth for a current generation instance with less than 32 vCPUs is limited to 5 Gbps.

Single-flow traffic

Baseline bandwidth for single-flow (5-tuple) traffic is limited to 5 Gbps when instances are not in the same [cluster placement group \(p. 1352\)](#). To reduce latency and increase single-flow bandwidth, try one of the following:

- Use a cluster placement group to achieve up to 10 Gbps bandwidth for instances within the same placement group.
- Set up multiple paths between two endpoints to achieve higher bandwidth with Multipath TCP (MPTCP).

- Configure ENA Express for eligible instances within the same subnet to achieve up to 25 Gbps between those instances.

Available instance bandwidth

The available network bandwidth of an instance depends on the number of vCPUs that it has. For example, an m5.8xlarge instance has 32 vCPUs and 10 Gbps network bandwidth, and an m5.16xlarge instance has 64 vCPUs and 20 Gbps network bandwidth. However, instances might not achieve this bandwidth; for example, if they exceed network allowances at the instance level, such as packet per second or number of tracked connections. How much of the available bandwidth the traffic can utilize depends on the number of vCPUs and the destination. For example, an m5.16xlarge instance has 64 vCPUs, so traffic to another instance in the Region can utilize the full bandwidth available (20 Gbps). However, traffic to another instance in a different Region can utilize only 50% of the bandwidth available (10 Gbps).

Typically, instances with 16 vCPUs or fewer (size 4xlarge and smaller) are documented as having "up to" a specified bandwidth; for example, "up to 10 Gbps". These instances have a baseline bandwidth. To meet additional demand, they can use a network I/O credit mechanism to burst beyond their baseline bandwidth. Instances can use burst bandwidth for a limited time, typically from 5 to 60 minutes, depending on the instance size.

An instance receives the maximum number of network I/O credits at launch. If the instance exhausts its network I/O credits, it returns to its baseline bandwidth. A running instance earns network I/O credits whenever it uses less network bandwidth than its baseline bandwidth. A stopped instance does not earn network I/O credits. Instance burst is on a best effort basis, even when the instance has credits available, as burst bandwidth is a shared resource.

There are separate network I/O credit buckets for inbound and outbound traffic.

Base and burst network performance

The following documentation describes the network performance for all instances, plus the baseline network bandwidth available for instances that can use burst bandwidth.

- [General purpose instances \(p. 233\)](#)
- [Compute optimized instances \(p. 279\)](#)
- [Memory optimized instances \(p. 291\)](#)
- [Storage optimized instances \(p. 313\)](#)
- [Accelerated computing instances \(p. 325\)](#)

To view network performance using the AWS CLI

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
aws ec2 describe-instance-types --filters "Name=instance-type,Values=c5.*" --query "InstanceTypes[].[InstanceType, NetworkInfo.NetworkPerformance]" --output table
-----
|      DescribeInstanceTypes      |
+-----+-----+
| c5.4xlarge | Up to 10 Gigabit |
| c5.xlarge  | Up to 10 Gigabit |
| c5.12xlarge| 12 Gigabit   |
| c5.24xlarge| 25 Gigabit   |
| c5.9xlarge | 10 Gigabit   |
```

c5.2xlarge	Up to 10 Gigabit
c5.large	Up to 10 Gigabit
c5.metal	25 Gigabit
c5.18xlarge	25 Gigabit

Monitor instance bandwidth

You can use CloudWatch metrics to monitor instance network bandwidth and the packets sent and received. You can use the network performance metrics provided by the Elastic Network Adapter (ENA) driver to monitor when traffic exceeds the network allowances that Amazon EC2 defines at the instance level.

You can configure whether Amazon EC2 sends metric data for the instance to CloudWatch using one-minute periods or five-minute periods. It is possible that the network performance metrics would show that an allowance was exceeded and packets were dropped while the CloudWatch instance metrics do not. This can happen when the instance has a short spike in demand for network resources (known as a microburst), but the CloudWatch metrics are not granular enough to reflect these microsecond spikes.

- [Instance metrics \(p. 1185\)](#)
- [Network performance metrics \(p. 1349\)](#)

Enhanced networking on Windows

Enhanced networking uses single root I/O virtualization (SR-IOV) to provide high-performance networking capabilities on [supported instance types \(p. 1326\)](#). SR-IOV is a method of device virtualization that provides higher I/O performance and lower CPU utilization when compared to traditional virtualized network interfaces. Enhanced networking provides higher bandwidth, higher packet per second (PPS) performance, and consistently lower inter-instance latencies. There is no additional charge for using enhanced networking.

For information about the supported network speed for each instance type, see [Amazon EC2 Instance Types](#).

Contents

- [Enhanced networking support \(p. 1326\)](#)
- [Enable enhanced networking on your instance \(p. 1327\)](#)
- [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances \(p. 1327\)](#)
- [Improve network performance with ENA Express on Windows instances \(p. 1338\)](#)
- [Enable enhanced networking with the Intel 82599 VF interface on Windows instances \(p. 1345\)](#)
- [Operating system optimizations \(p. 1348\)](#)
- [Monitor network performance for your EC2 instance \(p. 1349\)](#)

Enhanced networking support

All [current generation \(p. 212\)](#) instance types support enhanced networking, except for T2 instances.

You can enable enhanced networking using one of the following mechanisms:

Elastic Network Adapter (ENA)

The Elastic Network Adapter (ENA) supports network speeds of up to 100 Gbps for supported instance types.

The current generation instances use ENA for enhanced networking, except for C4, D2, and M4 instances smaller than m4.16xlarge.

Intel 82599 Virtual Function (VF) interface

The Intel 82599 Virtual Function interface supports network speeds of up to 10 Gbps for supported instance types.

The following instance types use the Intel 82599 VF interface for enhanced networking: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.

For a summary of the enhanced networking mechanisms by instance type, see [Summary of networking and storage features \(p. 220\)](#).

Enable enhanced networking on your instance

If your instance type supports the Elastic Network Adapter for enhanced networking, follow the procedures in [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Windows instances \(p. 1327\)](#).

If your instance type supports the Intel 82599 VF interface for enhanced networking, follow the procedures in [Enable enhanced networking with the Intel 82599 VF interface on Windows instances \(p. 1345\)](#).

Enable enhanced networking with the Elastic Network Adapter (ENA) on Windows instances

Amazon EC2 provides enhanced networking capabilities through the Elastic Network Adapter (ENA). To use enhanced networking, you must install the required ENA module and enable ENA support.

Contents

- [Requirements \(p. 1327\)](#)
- [Enhanced networking performance \(p. 1328\)](#)
- [Test whether enhanced networking is enabled \(p. 1328\)](#)
- [Enable enhanced networking on Windows \(p. 1329\)](#)
- [Install or upgrade Elastic Network Adapter \(ENA\) driver \(p. 1330\)](#)
- [Amazon ENA driver versions \(p. 1333\)](#)
- [Subscribe to notifications \(p. 785\)](#)

Requirements

To prepare for enhanced networking using the ENA, set up your instance as follows:

- Launch the instance using a [current generation \(p. 212\)](#) instance type, other than C4, D2, M4 instances smaller than m4.16xlarge, or T2.
- If the instance is running Windows Server 2008 R2 SP1, ensure that it has the [SHA-2 code signing support update](#).

- Ensure that the instance has internet connectivity.
- Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2 \(p. 5\)](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the enaSupport attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

Note

We require TLS 1.2 and recommend TLS 1.3. Your client must meet this requirement to download from Amazon Simple Storage Service (Amazon S3). For more information, see [TLS 1.2 to become the minimum TLS protocol level for all AWS API endpoints](#).

Enhanced networking performance

The following documentation provides a summary of the network performance for the instance types that support ENA enhanced networking:

- [Network Performance for Accelerated Computing Instances \(p. 325\)](#)
- [Network Performance for Compute Optimized Instances \(p. 284\)](#)
- [Network Performance for General Purpose Instances \(p. 233\)](#)
- [Network Performance for Memory Optimized Instances \(p. 300\)](#)
- [Network Performance for Storage Optimized Instances \(p. 316\)](#)

Test whether enhanced networking is enabled

To test whether enhanced networking is already enabled, verify that the driver is installed on your instance and that the enaSupport attribute is set.

Instance attribute (enaSupport)

To check whether an instance has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- [describe-instances](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instances --instance-ids instance_id --query  
"Reservations[].[Instances[].[EnaSupport"]
```

- [Get-EC2Instance](#) (Tools for Windows PowerShell)

```
(Get-EC2Instance -InstanceId instance-id).Instances.EnaSupport
```

Image attribute (enaSupport)

To check whether an AMI has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- [describe-images](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[].EnaSupport"
```

- [Get-EC2Image](#) (Tools for Windows PowerShell)

```
(Get-EC2Image -ImageId ami_id).EnaSupport
```

Enable enhanced networking on Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the enaSupport instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types and only if the ENA driver is installed. For more information, see [Enhanced networking support \(p. 1326\)](#).

To enable enhanced networking

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and 2019 only] Run the following EC2Launch PowerShell script to configure the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -  
Schedule
```

3. From the instance, install the driver as follows:

- a. [Download](#) the latest driver to the instance.
- b. Extract the zip archive.
- c. Install the driver by running the `install.ps1` PowerShell script.

Note

If you get an execution policy error, set the policy to Unrestricted (by default it is set to Restricted or RemoteSigned). In a command line, run `Set-ExecutionPolicy -ExecutionPolicy Unrestricted`, and then run the `install.ps1` PowerShell script again.

4. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI/AWS CloudShell), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.
5. Enable ENA support on your instance as follows:
 - a. From your local computer, check the EC2 instance ENA support attribute on your instance by running one of the following commands. If the attribute is not enabled, the output will be "[]" or blank. EnaSupport is set to false by default.
 - [describe-instances](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instances --instance-ids instance_id --query  
"Reservations[].Instances[].EnaSupport"
```

 - [Get-EC2Instance](#) (Tools for Windows PowerShell)

```
(Get-EC2Instance -InstanceId instance_id).Instances.EnaSupport
```
 - b. To enable ENA support, run one of the following commands:

- [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
```

- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
```

If you encounter problems when you restart the instance, you can also disable ENA support using one of the following commands:

- [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --no-ena-support
```

- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $false
```

- c. Verify that the attribute has been set to true using [describe-instances](#) or [Get-EC2Instance](#) as shown previously. You should now see the following output:

```
[  
    true  
]
```

6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances](#) (AWS CLI/AWS CloudShell), [Start-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance using the AWS OpsWorks console so that the instance state remains in sync.
7. On the instance, validate that the ENA driver is installed and enabled as follows:
 - a. Right-click the network icon and choose **Open Network and Sharing Center**.
 - b. Choose the Ethernet adapter (for example, **Ethernet 2**).
 - c. Choose **Details**. For **Network Connection Details**, check that **Description** is **Amazon Elastic Network Adapter**.
8. (Optional) Create an AMI from the instance. The AMI inherits the enaSupport attribute from the instance. Therefore, you can use this AMI to launch another instance with ENA enabled by default. For more information, see [Create a custom Windows AMI \(p. 151\)](#).

Install or upgrade Elastic Network Adapter (ENA) driver

If your instance isn't based on one of the latest Windows Amazon Machine Images (AMIs) that Amazon provides, use the following procedure to install the current ENA driver on your instance. You should perform this update at a time when it's convenient to reboot your instance. If the install script doesn't automatically reboot your instance, we recommend that you reboot the instance as the final step.

If you use an instance store volume to store data while the instance is running, that data is erased when you stop the instance. Before you stop your instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

Prerequisites

To install or upgrade the ENA driver, your Windows instance must meet the following prerequisites:

- Have PowerShell version 3.0 or later installed

Step 1: Back up your data

We recommend that you create a backup AMI, in case you're not able to roll back your changes through the **Device Manager**. To create a backup AMI with the AWS Management Console, follow these steps:

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires the driver upgrade, and choose **Stop instance** from the **Instance state** menu.
4. After the instance is stopped, select the instance again. To create your backup, choose **Image and templates** from the **Actions** menu, then choose **Create image**.
5. To restart your instance, choose **Start instance** from the **Instance state** menu.

Step 2: Install or upgrade your ENA driver

You can install or upgrade your ENA driver with AWS Systems Manager Distributor, or with PowerShell cmdlets. For further instructions, select the tab that matches the method that you want to use.

Systems Manager Distributor

You can use the Systems Manager Distributor feature to deploy packages to your Systems Manager managed nodes. With Systems Manager Distributor, you can install the ENA driver package once, or with scheduled updates. For more information about how to install the ENA driver package (`AwsEnaNetworkDriver`) with Systems Manager Distributor, see [Install or update packages](#) in the [AWS Systems Manager User Guide](#).

PowerShell

This section covers how to download and install ENA driver packages on your instance with PowerShell cmdlets.

Option 1: Download and extract the latest version

1. Connect to your instance and log in as the local administrator.
2. Use the **invoke-webrequest** cmdlet to download the latest driver package:

```
PS C:\> invoke-webrequest https://ec2-windows-drivers-downloads.s3.amazonaws.com/ENALatest/AwsEnaNetworkDriver.zip -outfile $env:USERPROFILE\AwsEnaNetworkDriver.zip
```

Note

Alternatively, you can download the latest driver package from a browser window on your instance.

3. Use the **expand-archive** cmdlet to extract the zip archive that you downloaded to your instance:

```
PS C:\> expand-archive $env:USERPROFILE\AwsEnaNetworkDriver.zip -DestinationPath $env:USERPROFILE\AwsEnaNetworkDriver
```

Option 2: Download and extract a specific version

1. Connect to your instance and log in as the local administrator.

2. Download the ENA driver package for the specific version you want from the version link in the [Amazon ENA driver versions \(p. 1333\)](#) table.
3. Extract the zip archive to your instance.

Install the ENA driver with PowerShell

The install steps are the same whether you've downloaded the latest driver or a specific version. To install the ENA driver, follow these steps.

1. To install the driver, run the `install.ps1` PowerShell script from the `AwsEnaNetworkDriver` directory on your instance. If you get an error, make sure that you're using PowerShell 3.0 or later.
2. If the installer doesn't automatically reboot your instance, run the **Restart-Computer** PowerShell cmdlet.

```
PS C:\> Restart-Computer
```

Step 3 (optional): Verify the ENA driver version after installation

To ensure that the ENA driver package was successfully installed on your instance, you can verify the new version as follows:

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

Note

ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To verify the current version that's installed, open the **Driver** tab and check the **Driver Version**. If the current version doesn't match your target version, see [Troubleshoot the Elastic Network Adapter \(ENA\) Windows driver \(p. 2150\)](#).

Roll back an ENA driver installation

If anything goes wrong with the installation, you might need to roll back the driver. Follow these steps to roll back to the previous version of the ENA driver that was installed on your instance.

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

Note

ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To roll back the driver, open the **Driver** tab and choose **Roll Back Driver**. This opens the **Driver Package rollback** window.

Note

If the **Driver** tab doesn't show the **Roll Back Driver** action, or if the action is unavailable, it means that the [Driver Store](#) on your instance doesn't contain the previously installed driver package. To troubleshoot this issue, see [Troubleshooting scenarios \(p. 2154\)](#), and expand the **Unexpected ENA driver version installed** section. For more information about the device driver package selection process, see [How Windows selects a driver package for a device](#) on the [Microsoft documentation website](#).

Amazon ENA driver versions

Windows AMIs include the Amazon ENA driver to enable enhanced networking.

The following table shows the corresponding ENA driver version to download for each Windows Server version.

Windows Server version	ENA driver version
Windows Server 2022	2.4.0 and later
Windows Server 2019	latest
Windows Server 2016	latest
Windows Server 2012 R2	latest
Windows Server 2012	latest
Windows Server 2008 R2	2.2.3 and earlier

The following table summarizes the changes for each release.

Driver version	Details	Release date
2.6.0	<p>New Features</p> <ul style="list-style-type: none">• Adds the following network performance metrics for instance types that support ENA Express.<ul style="list-style-type: none">• ena_srd_mode• ena_srd_tx_pkts• ena_srd_eligible_tx_pkts• ena_srd_rx_pkts• ena_srd_resource_utilization• Adds conntrack_allowance_available network performance metric for Nitro based instance types.• Adds new adapter reset reason due to detection of RX data corruption.• Updates driver logging infrastructure. <p>Bug Fixes</p> <ul style="list-style-type: none">• Prevents adapter reset in the event that CPU starvation causes a network performance metrics update to fail.	June 20, 2023

Driver version	Details	Release date
	<ul style="list-style-type: none"> Prevents false detection of an interruption to the device heartbeat. Fixes driver installation script to support downgrade operation. Fixes the receive error count statistic. 	
2.5.0	<p>Announcement</p> <p>ENA Windows driver version 2.5.0 has been rolled back due to failure to initialize on the Windows domain controller. Windows Client and Windows Server are unaffected.</p>	February 17, 2023
<u>2.4.0</u>	<p>New Features</p> <ul style="list-style-type: none"> Adds support for Windows Server 2022. Removes support for Windows Server 2008 R2. Sets Low Latency Queuing (LLQ) to always on to improve performance on sixth generation Amazon EC2 instances. <p>Bug Fix</p> <ul style="list-style-type: none"> Fixes a failure to publish network performance metrics to the Performance Counters for Windows (PCW) system. Fixes a memory leak during the registry key reading operation. Prevents an infinite reset loop in the event of an unrecoverable error during the adapter reset process. 	April 28, 2022
2.2.4	<p>Announcement</p> <p>ENA Windows driver version 2.2.4 has been rolled back due to potential performance degradation on the sixth generation EC2 instances. We recommend that you downgrade the driver, using one of the following methods:</p> <p>• Install the previous version</p> <ol style="list-style-type: none"> Download the previous version package from the link in this table (version 2.2.3). Run the install.ps1 PowerShell installation script. <p>For more details for pre- and post-installation steps see Enable enhanced networking on Windows (p. 1329).</p> <p>Use Amazon EC2 Systems Manager for a bulk update</p> <ul style="list-style-type: none"> Perform a bulk update via SSM document AWS-ConfigureAWSPackage, with the following parameters: <ul style="list-style-type: none"> Name: AwsEnaNetworkDriver Version: 2.2.3 	October 26, 2021

Driver version	Details	Release date
<u>2.2.3</u>	<p>New Feature</p> <ul style="list-style-type: none"> • Adds support for new Nitro cards with up to 400 Gbps instance networking. <p>Bug Fix</p> <ul style="list-style-type: none"> • Fixes race condition between system time change and system time query by the ENA driver, which causes false-positive detection of HW unresponsiveness. <p>Windows ENA driver version 2.2.3 is the final version that supports Windows Server 2008 R2. Currently available instance types that use ENA will continue to be supported on Windows Server 2008 R2, and the drivers are available by download. No future instance types will support Windows Server 2008 R2, and you cannot launch, import, or migrate Windows Server 2008 R2 images to future instance types.</p>	March 25, 2021
<u>2.2.2</u>	<p>New Feature</p> <ul style="list-style-type: none"> • Adds support to query network adapter performance metrics with CloudWatch and the Performance Counters for Windows consumers. <p>Bug Fix</p> <ul style="list-style-type: none"> • Fixes performance issues on bare metal instances. 	December 21, 2020
<u>2.2.1</u>	<p>New Feature</p> <ul style="list-style-type: none"> • Adds a method to allow the host to query the Elastic Network Adapter for network performance metrics. 	October 1, 2020
<u>2.2.0</u>	<p>New Features</p> <ul style="list-style-type: none"> • Adds support for next generation hardware types. • Improves instance start time after resuming from stop-hibernate, and eliminates false positive ENA error messages. <p>Performance Optimizations</p> <ul style="list-style-type: none"> • Optimizes processing of inbound traffic. • Improves shared memory management in low resource environment. <p>Bug Fix</p> <ul style="list-style-type: none"> • Avoids system crash upon ENA device removal in rare scenario where driver fails to reset. 	August 12, 2020

Driver version	Details	Release date
<u>2.1.5</u>	<p>Bug Fix</p> <ul style="list-style-type: none"> Fixes occasional network adapter initialization failure on bare metal instances. 	June 23, 2020
<u>2.1.4</u>	<p>Bug Fixes</p> <ul style="list-style-type: none"> Prevent connectivity issues caused by corrupted LSO packet metadata arriving from the network stack. Prevent system crash caused by a rare race condition that results in accessing an already released packet memory. 	November 25, 2019
<u>2.1.2</u>	<p>New Feature</p> <ul style="list-style-type: none"> Added support for vendor ID report to allow OS to generate MAC-based UUIDs. <p>Bug Fixes</p> <ul style="list-style-type: none"> Improved DHCP network configuration performance during initialization. Properly calculate L4 checksum on inbound IPv6 traffic when the maximum transmission unit (MTU) exceeds 4K. General improvements to driver stability and minor bug fixes. 	November 4, 2019
<u>2.1.1</u>	<p>Bug Fixes</p> <ul style="list-style-type: none"> Prevent drops of highly fragmented TCP LSO packets arriving from operating system. Properly handle Encapsulating Security Payload (ESP) protocol within the IPSec in IPv6 networks. 	September 16, 2019

Driver version	Details	Release date
2.1.0	<p>ENA Windows driver v2.1 introduces new ENA device capabilities, provides a performance boost, adds new features, and includes multiple stability improvements.</p> <ul style="list-style-type: none"> • New features <ul style="list-style-type: none"> • Use standardized Windows registry key for Jumbo frames configuration. • Allow VLAN ID setting via the ENA driver properties GUI. • Improved Recovery flows <ul style="list-style-type: none"> • Improved failure identification mechanism. • Added support for tunable recovery parameters. • Support up to 32 I/O queues for newer EC2 instances that have more than 8 vCPUs. • ~90% reduction of driver memory footprint. • Performance optimizations <ul style="list-style-type: none"> • Reduced transmit path latency. • Support for receive checksum offload. • Performance optimization for heavily loaded system (optimized usage of locking mechanisms). • Further enhancements to reduce CPU utilization and improve system responsiveness under load. • Bug Fixes <ul style="list-style-type: none"> • Fix crash due to invalid parsing of non-contiguous Tx headers. • Fix driver v1.5 crash during the elastic network interface detach on Bare Metal instances. • Fix LSO pseudo-header checksum calculation error over IPv6. • Fix potential memory resource leak upon initialization failure. • Disable TCP/UDP checksum offload for IPv4 fragments. • Fix for VLAN configuration. VLAN was incorrectly disabled when only VLAN priority should have been disabled. • Enable correct parsing of custom driver messages by the event viewer. • Fix failure to initialize driver due to invalid timestamp handling. • Fix race condition between data processing and ENA device disabling. 	July 1, 2019
1.5.0	<ul style="list-style-type: none"> • Improved stability and performance fixes. • Receive Buffers can now be configured up to a value of 8192 in Advanced Properties of the ENA NIC. • Default Receive Buffers of 1k. 	October 4, 2018
1.2.3	Includes reliability fixes and unifies support for Windows Server 2008 R2 through Windows Server 2016.	February 13, 2018

Driver version	Details	Release date
1.0.8	The initial release. Included in AMIs for Windows Server 2008 R2, Windows Server 2012 RTM, Windows Server 2012 R2, and Windows Server 2016.	July 2016

Subscribe to notifications

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use the following procedure to subscribe to these notifications.

To subscribe to EC2 notifications

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.
5. In the **Create subscription** dialog box, do the following:
 - a. For **TopicARN**, copy the following Amazon Resource Name (ARN):
`arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers`
 - b. For **Protocol**, choose Email.
 - c. For **Endpoint**, enter an email address that you can use to receive the notifications.
 - d. Choose **Create subscription**.
6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

To unsubscribe from Amazon EC2 Windows driver notification

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. In the navigation pane, choose **Subscriptions**.
3. Select the check box for the subscription and then choose **Actions**, **Delete subscriptions**. When prompted for confirmation, choose **Delete**.

Improve network performance with ENI Express on Windows instances

ENI Express is powered by AWS Scalable Reliable Datagram (SRD) technology. SRD is a high performance network transport protocol that uses dynamic routing to increase throughput and minimize tail latency. With ENI Express, you can communicate between two EC2 instances in the same subnet.

Benefits of ENI Express

- Increases the maximum bandwidth a single flow can use from 5 Gbps to 25 Gbps within the subnet.
- Reduces tail latency of network traffic between EC2 instances, especially during periods of high network load.

- Detects and avoids congested network paths.
- Handles some tasks directly in the network layer, such as packet reordering on the receiving end, and most retransmits that are needed. This frees up the application layer for other work.

Note

If your application sends or receives a high volume of packets per second, and needs to optimize for latency most of the time, especially during periods when there is no congestion on the network, [Enhanced networking \(p. 1326\)](#) might be a better fit for your network.

During periods of time when network traffic is light, you might notice a slight increase in packet latency (tens of microseconds) when the packet uses ENA Express. During those times, applications that prioritize specific network performance characteristics can benefit from ENA Express as follows:

- Processes can benefit from increased maximum single flow bandwidth from 5 Gbps to 25 Gbps within the same subnet.
- Longer running processes should experience reduced tail latency during periods of network congestion.
- Processes can benefit from a smoother and more standard distribution for network response times.

How ENA Express works

SRD technology uses a packet spraying mechanism to distribute load and avoid network congestion. It distributes packets for each network flow across different AWS network paths, and dynamically adjusts distribution when it detects signs of congestion. It also manages packet reordering on the receiving end.

To ensure that ENA Express can manage network traffic as intended, sending and receiving instances and the communication between them must meet all of the following requirements:

- Both sending and receiving instance types are supported. See the [Supported instance types for ENA Express \(p. 1340\)](#) table for more information.
- Both sending and receiving instances must have ENA Express configured. If there are differences in the configuration, you can run into situations where traffic defaults to standard ENA transmission. The following scenario shows what can happen.

Scenario: Differences in configuration

Instance	ENA Express Enabled	UDP uses ENA Express
Instance 1	Yes	Yes
Instance 2	Yes	No

In this case, TCP traffic between the two instances can use ENA Express, as both instances have enabled it. However, since one of the instances does not use ENA Express for UDP traffic, communication between these two instances over UDP uses standard ENA transmission.

- The sending and receiving instances must run in the same subnet.
- The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.

If any requirement is unmet, the instances use the standard TCP/UDP protocol but without SRD to communicate.

Note

Amazon EC2 refers to the relationship between an instance and a network interface that's attached to it as an *attachment*. ENI Express settings apply to the attachment. If the network interface is detached from the instance, the attachment no longer exists, and the ENI Express settings that applied to it are no longer in force. The same is true when an instance is terminated, even if the network interface remains.

Supported instance types for ENI Express

The following table contains instance types that support ENI Express.

Instance type	Architecture
General purpose	
m6a.48xlarge	x86_64
m6a.metal	x86_64
m6i.32xlarge	x86_64
m6i.metal	x86_64
m6id.32xlarge	x86_64
m6id.metal	x86_64
Compute optimized	
c6a.48xlarge	x86_64
c6a.metal	x86_64
c6i.32xlarge	x86_64
c6i.metal	x86_64
c6id.32xlarge	x86_64
c6id.metal	x86_64
Memory optimized	
r6a.48xlarge	x86_64
r6a.metal	x86_64
r6i.32xlarge	x86_64
r6i.metal	x86_64
r6id.32xlarge	x86_64
r6id.metal	x86_64
x2idn.32xlarge	x86_64
x2idn.metal	x86_64
x2iedn.32xlarge	x86_64

Instance type	Architecture
x2iedn.metal	x86_64
Storage optimized	
i4i.32xlarge	x86_64
i4i.metal	x86_64

List and view ENA Express settings

This section covers how to list and view ENA Express information from the AWS Management Console or from the AWS CLI. For more information, choose the tab that matches the method you'll use.

Console

This tab covers how to find information about your current ENA Express settings and to view instance type support in the AWS Management Console.

View instance type support

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instance types**.
3. Select an instance type to see the details for that instance. You can choose the **Instance type** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Networking** tab or that section on the detail page, **ENA Express support** shows a true or false value to indicate if the instance type supports this feature.

View settings from the Network interface list

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface to see the details for that instance. You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Network interface attachment** section on the the **Details** tab or detail page, review settings for **ENA Express** and **ENA Express UDP**.

View settings from instances

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select an instance to see the details for that instance. You can choose the **Instance ID** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Network interfaces** section on the **Networking** tab, scroll right to review settings for **ENA Express** and **ENA Express UDP**.

AWS CLI

This tab covers how to find information about your current ENA Express settings and to view instance type support in the AWS CLI.

Describe instance types

For information on instance type settings for a specific instance type, run the [describe-instance-types](#) command in the AWS CLI, and substitute the instance type as follows:

```
[ec2-user ~]$ aws ec2 describe-instance-types --instance-types m6i.metal
{
  "InstanceTypes": [
    {
      "InstanceType": "m6i.metal",
      "CurrentGeneration": true,
      ...
    },
    "NetworkInfo": {
      ...
      "EnaSrdSupported": true
    },
    ...
  ]
}
```

Describe network interfaces

For information on instance type settings, run the [describe-network-interfaces](#) command in the AWS CLI as follows:

```
[ec2-user ~]$ aws ec2 describe-network-interfaces
{
  "NetworkInterfaces": [
    {
      "Association": {
        .... IPs, DNS...
      },
      "Attachment": {
        "AttachTime": "2022-11-17T09:04:28+00:00",
        "AttachmentId": "eni-attach-0ab1c23456d78e9f0",
        "DeleteOnTermination": true,
        "DeviceIndex": 0,
        "NetworkCardIndex": 0,
        "InstanceId": "i-0abcd123e456fabcd",
        "InstanceOwnerId": "111122223333",
        "Status": "attached",
        "EnaSrdSpecification": {
          "EnaSrdEnabled": true,
          "EnaSrdUdpSpecification": {
            "EnaSrdUdpEnabled": true
          }
        }
      },
      ...
      "NetworkInterfaceId": "eni-0d1234e5f6a78901b",
      "OwnerId": "111122223333",
      ...
    ]
}
```

Configure ENA Express settings

You can configure ENA Express for supported EC2 instance types without needing to install any additional software. This section covers how to configure ENA Express from the AWS Management Console or from the AWS CLI. For more information, choose the tab that matches the method you'll use.

Console

This tab covers how to manage ENA Express settings for network interfaces that are attached to an instance.

Manage ENA Express from the Network interface list

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is attached to an instance. You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.
4. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page. This opens the **Manage ENA Express** dialog, with the selected network interface ID and current settings displayed.

Note

If the network interface you selected is not attached to an instance, this action does not appear in the menu.

5. To use **ENA Express**, select the **Enable** check box.
6. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** check box.
7. To save your settings, choose **Save**.

Manage ENA Express from the Instance list

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select the instance that you want to manage. You can choose the **Instance ID** to open the detail page, or you can select the checkbox on the left side of the list.
4. Select the **Network interface** to configure for your instance.
5. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page.
6. To configure ENA Express for a network interface that's attached to your instance, select it from the **Network interface** list.
7. To use **ENA Express** for the selected network interface attachment, select the **Enable** check box.
8. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** check box.
9. To save your settings, choose **Save**.

Configure ENA Express when you attach a network interface to an EC2 instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is not attached to an instance (**Status** is *Available*). You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.
4. Select the **Instance** that you'll attach to.

5. To use **ENI Express** after you attach the network interface to the instance, select the **Enable** check box.
6. When ENI Express is enabled, you can configure UDP settings. To use **ENI Express UDP**, select the **Enable** check box.
7. To attach the network interface to the instance and save your ENI Express settings, choose **Attach**.

AWS CLI

This tab covers how to configure ENI Express settings in the AWS CLI.

Configure ENI Express when you attach a network interface

To configure ENI Express when you attach a network interface to an instance, run the [attach-network-interface](#) command in the AWS CLI, as shown in the following examples:

Example 1: Use ENI Express for TCP traffic, but not for UDP traffic

In this example, we configure EnaSrdEnabled as *true*, and we allow EnaSrdUdpEnabled to default to *false*.

```
[ec2-user ~]$ aws ec2 attach-network-interface --network-interface-id eni-0123f4567890a1b23 --instance-id i-0f1a234b5cd67e890 --device-index 1 --ena-srd-specification 'EnaSrdEnabled=true'  
{  
    "AttachmentId": "eni-attach-012c3d45e678f9012"  
}
```

Example 2: Use ENI Express for both TCP traffic and UDP traffic

In this example, we configure both EnaSrdEnabled and EnaSrdUdpEnabled as *true*.

```
[ec2-user ~]$ aws ec2 attach-network-interface --network-interface-id eni-0123f4567890a1b23 --instance-id i-0f1a234b5cd67e890 --device-index 1 --ena-srd-specification 'EnaSrdEnabled=true,EnaSrdUdpSpecification={EnaSrdUdpEnabled=true}'  
{  
    "AttachmentId": "eni-attach-012c3d45e678f9012"  
}
```

Update ENI Express settings for your network interface attachment

To update ENI Express settings for a network interface that's attached to an instance, run the [modify-network-interface-attribute](#) command in the AWS CLI, as shown in the following examples:

Example 1: Use ENI Express for TCP traffic, but not for UDP traffic

In this example, we configure EnaSrdEnabled as *true*, and we allow EnaSrdUdpEnabled to default to *false* if it has never been set previously.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --network-interface-id eni-0123f4567890a1b23 --ena-srd-specification 'EnaSrdEnabled=true'
```

Example 2: Use ENI Express for both TCP traffic and UDP traffic

In this example, we configure both EnaSrdEnabled and EnaSrdUdpEnabled as *true*.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --network-interface-id eni-0123f4567890a1b23 --ena-srd-specification 'EnaSrdEnabled=true,EnaSrdUdpSpecification={EnaSrdUdpEnabled=true}'
```

Example 3: Stop using ENA Express for UDP traffic

In this example, we configure EnaSrdUdpEnabled as *false*.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --  
network-interface-id eni-0123f4567890a1b23 --ena-srd-specification  
'EnaSrdUdpSpecification={EnaSrdUdpEnabled=false}'
```

Enable enhanced networking with the Intel 82599 VF interface on Windows instances

Amazon EC2 provides enhanced networking capabilities through the Intel 82599 VF interface, which uses the Intel ixgbevf driver.

Contents

- [Requirements \(p. 1345\)](#)
- [Test whether enhanced networking is enabled \(p. 1345\)](#)
- [Enable enhanced networking on Windows \(p. 1346\)](#)

Requirements

To prepare for enhanced networking using the Intel 82599 VF interface, set up your instance as follows:

- Select from the following supported instance types: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.
- Launch the instance from a 64-bit HVM AMI. You can't enable enhanced networking on Windows Server 2008 and Windows Server 2003. Enhanced networking is already enabled for Windows Server 2012 R2 and Windows Server 2016 and later AMIs. Windows Server 2012 R2 includes Intel driver 1.0.15.3 and we recommend that you upgrade that driver to the latest version using the Pnputil.exe utility.
- Ensure that the instance has internet connectivity.
- Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2 \(p. 5\)](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the sriovNetSupport attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

Test whether enhanced networking is enabled

Enhanced networking with the Intel 82599 VF interface is enabled if the driver is installed on your instance and the sriovNetSupport attribute is set.

Driver

To verify that the driver is installed, connect to your instance and open Device Manager. You should see "Intel(R) 82599 Virtual Function" listed under **Network adapters**.

Instance attribute (srivNetSupport)

To check whether an instance has the enhanced networking srivNetSupport attribute set, use one of the following commands:

- [describe-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instance-attribute --instance-id instance_id --attribute srivNetSupport
```

- [Get-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Get-EC2InstanceAttribute -InstanceId instance_id -Attribute srivNetSupport
```

If the attribute isn't set, SriosNetSupport is empty. If the attribute is set, the value is simple, as shown in the following example output.

```
"SriosNetSupport": {  
    "Value": "simple"  
},
```

Image attribute (srivNetSupport)

To check whether an AMI already has the enhanced networking srivNetSupport attribute set, use one of the following commands:

- [describe-images](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[].SriosNetSupport"
```

- [Get-EC2Image](#) (AWS Tools for Windows PowerShell)

```
(Get-EC2Image -ImageId ami_id).SriosNetSupport
```

If the attribute isn't set, SriosNetSupport is empty. If the attribute is set, the value is simple.

Enable enhanced networking on Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the srivNetSupport instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types. For more information, see [Enhanced networking support \(p. 1326\)](#).

Important

To view the latest version of the Intel driver in the Windows AMIs, see [Details about AWS Windows AMI versions \(p. 56\)](#).

Warning

There is no way to disable the enhanced networking attribute after you've enabled it.

To enable enhanced networking

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and later] Run the following EC2 Launch PowerShell script to configure the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -  
Schedule
```

Important

The administrator password will reset when you enable the initialize instance EC2 Launch script. You can modify the configuration file to disable the administrator password reset by specifying it in the settings for the initialization tasks. For steps on how to disable password reset, see [Configure initialization tasks \(p. 747\)](#).

3. From the instance, download the Intel network adapter driver for your operating system:

- **Windows Server 2022**

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2019** including for Server version 1809 and later*

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2016** including for Server version 1803 and earlier*

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2012 R2**

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2012**

Visit the [download page](#) and download `Wired_driver_version_x64.zip`.

- **Windows Server 2008 R2**

Visit the [download page](#) and download `PROWinx64Legacy.exe`.

*Server versions 1803 and earlier as well as 1809 and later are not specifically addressed on the Intel Drivers and Software pages.

4. Install the Intel network adapter driver for your operating system.

- **Windows Server 2008 R2**

1. In the **Downloads** folder, locate the `PROWinx64Legacy.exe` file and rename it to `PROWinx64Legacy.zip`.

2. Extract the contents of the `PROWinx64Legacy.zip` file.

3. Open the command line, navigate to the extracted folder, and run the following command to use the `pnputil` utility to add and install the INF file in the driver store.

```
C:\> pnputil -a PROXGB\Winx64\NDIS62\vxn62x64.inf
```

- **Windows Server 2022, Windows Server 2019, Windows Server 2016, Windows Server 2012 R2, and Windows Server 2012**

1. In the **Downloads** folder, extract the contents of the `Wired_driver_version_x64.zip` file.

2. In the extracted folder, locate the `Wired_driver_version_x64.exe` file and rename it to `Wired_driver_version_x64.zip`.

3. Extract the contents of the `Wired_driver_version_x64.zip` file.

4. Open the command line, navigate to the extracted folder, and run one of the following commands to use the `pnputil` utility to add and install the INF file in the driver store.

- **Windows Server 2019**

```
C:\> pnputil -i -a PROXGB\Winx64\NDIS68\vxn68x64.inf
```

- Windows Server 2016

```
C:\> pnputil -i -a PROXGB\Winx64\NDIS65\vxn65x64.inf
```

- Windows Server 2012 R2

```
C:\> pnputil -i -a PROXGB\Winx64\NDIS64\vxn64x64.inf
```

- Windows Server 2012

```
C:\> pnputil -i -a PROXGB\Winx64\NDIS63\vxn63x64.inf
```

5. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.
6. From your local computer, enable the enhanced networking attribute using one of the following commands:
 - [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --srivnet-support simple
```

 - [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"
```
7. (Optional) Create an AMI from the instance, as described in [Create a custom Windows AMI \(p. 151\)](#). The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances](#) (AWS CLI), [Start-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

Operating system optimizations

To achieve the maximum network performance on instances with enhanced networking, you might need to modify the default operating system configuration. We recommend the following configuration changes for applications that require high network performance. Other optimizations (such as turning on checksum offloading and enabling RSS, for example) are already in place on official Windows AMIs.

Note

TCP chimney offloading should be disabled in most use cases, and has been deprecated as of Windows Server 2016.

In addition to these operating system optimizations, you should also consider the maximum transmission unit (MTU) of your network traffic, and adjust according to your workload and network architecture. For more information, see [Network maximum transmission unit \(MTU\) for your EC2 instance \(p. 1368\)](#).

AWS regularly measures average round trip latencies between instances launched in a cluster placement group of 50us and tail latencies of 200us at the 99.9 percentile. If your applications require consistently

low latencies, we recommend using the latest version of the ENA drivers on fixed performance instances built on the Nitro System.

Configure RSS CPU affinity

Receive side scaling (RSS) is used to distribute network traffic CPU load across multiple processors. By default, the official Amazon Windows AMIs are configured with RSS enabled. ENA ENIs provide up to eight RSS queues. By defining CPU affinity for RSS queues, as well as for other system processes, it is possible to spread the CPU load out over multi-core systems, enabling more network traffic to be processed. On instance types with more than 16 vCPUs, we recommend you use the `Set-NetAdapterRss` PowerShell cmdlet (available from Windows Server 2012 and later), which manually excludes the boot processor (logical processor 0 and 1 when hyper-threading is enabled) from the RSS configuration for all ENIs, in order to prevent contention with various system components.

Windows is hyper-thread aware and will ensure the RSS queues of a single NIC are always placed on different physical cores. Therefore, unless hyper-threading is disabled, in order to completely prevent contention with other NICs, spread the RSS configuration of each NIC among a range of 16 logical processors. The `Set-NetAdapterRss` cmdlet allows you to define the per-NIC range of valid logical processors by defining the values of `BaseProcessorGroup`, `BaseProcessorNumber`, `MaxProcessingGroup`, `MaxProcessorNumber`, and `NumaNode` (optional). If there are not enough physical cores to completely eliminate inter-NIC contention, minimize the overlapping ranges or reduce the number of logical processors in the ENI ranges depending on the expected workload of the ENI (in other words, a low volume admin network ENI may not need as many RSS queues assigned). Also, as previously noted, various components must run on CPU 0, and therefore we recommend excluding it from all RSS configurations when sufficient vCPUs are available.

For example, when there are three ENIs on a 72 vCPU instance with 2 NUMA nodes with hyper-threading enabled, the following commands spread the network load between the two CPUs without overlap and prevent the use of core 0 completely.

```
Set-NetAdapterRss -Name NIC1 -BaseProcessorGroup 0 -BaseProcessorNumber 2 -  
MaxProcessorNumber 16  
Set-NetAdapterRss -Name NIC2 -BaseProcessorGroup 1 -BaseProcessorNumber 0 -  
MaxProcessorNumber 14  
Set-NetAdapterRss -Name NIC3 -BaseProcessorGroup 1 -BaseProcessorNumber 16 -  
MaxProcessorNumber 30
```

Note that these settings are persistent for each network adapter. If an instance is resized to one with a different number of vCPUs, you should reevaluate the RSS configuration for each enabled ENI. The complete Microsoft documentation for the `Set-NetAdapterRss` cmdlet can be found here: <https://docs.microsoft.com/en-us/powershell/module/netadapter/set-netadapterrss>.

Special note for SQL workloads: We also recommend that you review your I/O thread affinity settings along with your ENI RSS configuration to minimize I/O and network contention for the same CPUs. See [affinity mask Server Configuration Option](#).

Monitor network performance for your EC2 instance

The Elastic Network Adapter (ENA) driver publishes network performance metrics from the instances where they are enabled. You can use these metrics to troubleshoot instance performance issues, choose the right instance size for a workload, plan scaling activities proactively, and benchmark applications to determine whether they maximize the performance available on an instance.

Amazon EC2 defines network maximums at the instance level to ensure a high-quality networking experience, including consistent network performance across instance sizes. AWS provides maximums for the following for each instance:

- **Bandwidth capability** – Each EC2 instance has a maximum bandwidth for aggregate inbound and outbound traffic, based on instance type and size. Some instances use a network I/O credit mechanism to allocate network bandwidth based on average bandwidth utilization. Amazon EC2 also has maximum bandwidth for traffic to AWS Direct Connect and the internet. For more information, see [Amazon EC2 instance network bandwidth \(p. 1324\)](#).
- **Packet-per-second (PPS) performance** – Each EC2 instance has a maximum PPS performance, based on instance type and size.
- **Connections tracked** – The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance. For more information, see [Security group connection tracking \(p. 1677\)](#)
- **Link-local service access** – Amazon EC2 provides a maximum PPS per network interface for traffic to services such as the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.

When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets. You can monitor when traffic exceeds a maximum using the network performance metrics. These metrics inform you, in real time, of impact to network traffic and possible network performance issues.

Contents

- [Requirements \(p. 1350\)](#)
- [Metrics for the ENA driver \(p. 1350\)](#)
- [View the network performance metrics for your Windows instance \(p. 1351\)](#)

Requirements

- Install ENA driver version 2.2.2 or later. To verify the installed version, use Device Manager as follows.
 1. Open Device Manager by running devmgmt.msc.
 2. Expand **Network Adapters**.
 3. Choose **Amazon Elastic Network Adapter, Properties**.
 4. On the **Driver** tab, locate **Driver Version**.To upgrade your ENA driver, see [Enhanced networking \(p. 1327\)](#).
- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see [Collect advanced network metrics](#) in the *Amazon CloudWatch User Guide*.

Metrics for the ENA driver

The ENA driver delivers the following metrics to the instance in real time. They provide the cumulative number of packets queued or dropped on each network interface since the last driver reset.

Metric	Description	Supported on
bw_in_allowance_exceeded	The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.	All instance types
bw_out_allowance_exceeded	The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.	All instance types

Metric	Description	Supported on
conntrack_allowance_exceeded	The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.	All instance types
conntrack_allowance_available	The number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type.	Nitro-based instance types (p. 218) only. Not supported with FreeBSD instances or DPDK environments.
linklocal_allowance_exceeded	The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.	All instance types
pps_allowance_exceeded	The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance.	All instance types

View the network performance metrics for your Windows instance

You can view the metrics using any consumer of Windows performance counters. The data can be parsed according to the EnaPerfCounters manifest. This is an XML file that defines the performance counter provider and its countersets.

Manifest installation

If you launched the instance using an AMI that contains ENA driver 2.2.2 or later, or used the install script in the driver package for ENA driver 2.2.2, the manifest is already installed. To install the manifest manually, use the following steps:

1. Remove the existing manifest using the following command:

```
unlodctr /m:EnaPerfCounters.man
```

2. Copy the manifest file EnaPerfCounters.man from the driver installation package to %SystemRoot%\System32\drivers.
3. Install the new manifest using the following command:

```
lodctr /m:EnaPerfCounters.man
```

View metrics using Performance Monitor

1. Open Performance Monitor.

2. Press Ctrl+N to add new counters.
3. Choose **ENPA Packets Shaping** from the list.
4. Select the instances to monitor and choose **Add**.
5. Choose **OK**.

Placement groups

When you launch a new EC2 instance, the EC2 service attempts to place the instance in such a way that all of your instances are spread out across underlying hardware to minimize correlated failures. You can use *placement groups* to influence the placement of a group of *interdependent* instances to meet the needs of your workload. Depending on the type of workload, you can create a placement group using one of the following placement strategies:

- **Cluster** – packs instances close together inside an Availability Zone. This strategy enables workloads to achieve the low-latency network performance necessary for tightly-coupled node-to-node communication that is typical of high-performance computing (HPC) applications.
- **Partition** – spreads your instances across logical partitions such that groups of instances in one partition do not share the underlying hardware with groups of instances in different partitions. This strategy is typically used by large distributed and replicated workloads, such as Hadoop, Cassandra, and Kafka.
- **Spread** – strictly places a small group of instances across distinct underlying hardware to reduce correlated failures.

There is no charge for creating a placement group.

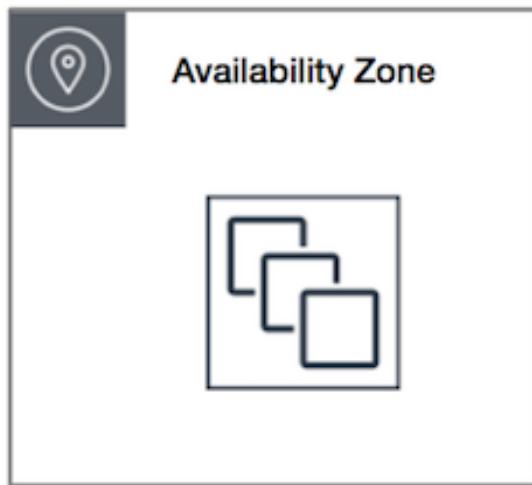

Placement group strategies

You can create a placement group using one of the following placement strategies:

Cluster placement groups

A cluster placement group is a logical grouping of instances within a single Availability Zone. A cluster placement group can span peered virtual private networks (VPCs) in the same Region. Instances in the same cluster placement group enjoy a higher per-flow throughput limit for TCP/IP traffic and are placed in the same high-bisection bandwidth segment of the network.

The following image shows instances that are placed into a cluster placement group.

Cluster placement groups are recommended for applications that benefit from low network latency, high network throughput, or both. They are also recommended when the majority of the network traffic is between the instances in the group. To provide the lowest latency and the highest packet-per-second network performance for your placement group, choose an instance type that supports enhanced networking. For more information, see [Enhanced Networking \(p. 1326\)](#).

We recommend that you launch your instances in the following way:

- Use a single launch request to launch the number of instances that you need in the placement group.
- Use the same instance type for all instances in the placement group.

If you try to add more instances to the placement group later, or if you try to launch more than one instance type in the placement group, you increase your chances of getting an insufficient capacity error.

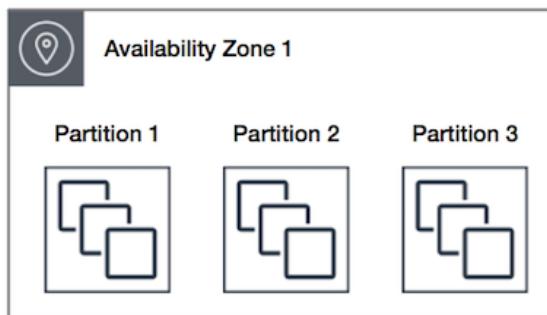

If you stop an instance in a placement group and then start it again, it still runs in the placement group. However, the start fails if there isn't enough capacity for the instance.

If you receive a capacity error when launching an instance in a placement group that already has running instances, stop and start all of the instances in the placement group, and try the launch again. Starting the instances may migrate them to hardware that has capacity for all of the requested instances.

Partition placement groups

Partition placement groups help reduce the likelihood of correlated hardware failures for your application. When using partition placement groups, Amazon EC2 divides each group into logical segments called partitions. Amazon EC2 ensures that each partition within a placement group has its own set of racks. Each rack has its own network and power source. No two partitions within a placement group share the same racks, allowing you to isolate the impact of hardware failure within your application.

The following image is a simple visual representation of a partition placement group in a single Availability Zone. It shows instances that are placed into a partition placement group with three partitions—**Partition 1**, **Partition 2**, and **Partition 3**. Each partition comprises multiple instances. The instances in a partition do not share racks with the instances in the other partitions, allowing you to contain the impact of a single hardware failure to only the associated partition.

Partition placement groups can be used to deploy large distributed and replicated workloads, such as HDFS, HBase, and Cassandra, across distinct racks. When you launch instances into a partition placement group, Amazon EC2 tries to distribute the instances evenly across the number of partitions that you specify. You can also launch instances into a specific partition to have more control over where the instances are placed.

A partition placement group can have partitions in multiple Availability Zones in the same Region. A partition placement group can have a maximum of seven partitions per Availability Zone. The number of instances that can be launched into a partition placement group is limited only by the limits of your account.

In addition, partition placement groups offer visibility into the partitions — you can see which instances are in which partitions. You can share this information with topology-aware applications, such as HDFS, HBase, and Cassandra. These applications use this information to make intelligent data replication decisions for increasing data availability and durability.

If you start or launch an instance in a partition placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

Spread placement groups

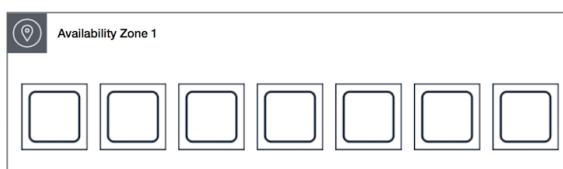

A spread placement group is a group of instances that are each placed on distinct hardware.

Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. Launching instances in a spread level placement group reduces the risk of simultaneous failures that might occur when instances share the same equipment. Spread level placement groups provide access to distinct hardware, and are therefore suitable for mixing instance types or launching instances over time.

If you start or launch an instance in a spread placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later. Placement groups can spread instances across racks or hosts. You can use host level spread placement groups only with AWS Outposts.

Rack spread level placement groups

The following image shows seven instances in a single Availability Zone that are placed into a spread placement group. The seven instances are placed on seven different racks, each rack has its own network and power source.

A rack spread placement group can span multiple Availability Zones in the same Region. For rack spread level placement groups, you can have a maximum of seven running instances per Availability Zone per group.

Host level spread placement groups

Host spread level placement groups are only available with AWS Outposts. For host spread level placement groups, there are no restrictions for running instances per Outposts. For more information, see [the section called "Placement groups on AWS Outposts" \(p. 1368\)](#).

Placement group rules and limitations

Topics

- [General rules and limitations \(p. 1355\)](#)
- [Cluster placement group rules and limitations \(p. 1355\)](#)
- [Partition placement group rules and limitations \(p. 1356\)](#)
- [Spread placement group rules and limitations \(p. 1356\)](#)

General rules and limitations

Before you use placement groups, be aware of the following rules:

- You can create a maximum of 500 placement groups per account in each Region.
- The name that you specify for a placement group must be unique within your AWS account for the Region.
- You can't merge placement groups.
- An instance can be launched in one placement group at a time; it cannot span multiple placement groups.
- [On-Demand Capacity Reservation \(p. 506\)](#) and [zonal Reserved Instances \(p. 355\)](#) provide a capacity reservation for EC2 instances in a specific Availability Zone. The capacity reservation can be used by instances in a placement group. When using a cluster placement group with capacity reservation, it is recommended that you reserve capacity within the cluster placement group. For more information, see [Capacity Reservations in cluster placement groups](#).

[Zonal Reserved Instances \(p. 355\)](#) provide a capacity reservation for instances in a specific Availability Zone. The capacity reservation can be used by instances in a placement group. However, it is not possible to explicitly reserve capacity in a placement group using a zonal Reserved Instance.

- You can't launch Dedicated Hosts in placement groups.
- You can't launch a Spot Instance that is configured to stop or hibernate on interruption in a placement group.

Cluster placement group rules and limitations

The following rules apply to cluster placement groups:

- The following instance types are supported:
 - [Current generation \(p. 212\)](#) instances, except for [burstable performance \(p. 245\)](#) instances (for example, T2).
 - The following [previous generation \(p. 217\)](#) instances: A1, C3, G2, I2, and R3.
- A cluster placement group can't span multiple Availability Zones.

- The maximum network throughput speed of traffic between two instances in a cluster placement group is limited by the slower of the two instances. For applications with high-throughput requirements, choose an instance type with network connectivity that meets your requirements.
- For instances that are enabled for enhanced networking, the following rules apply:
 - Instances within a cluster placement group can use up to 10 Gbps for single-flow traffic. Instances that are not within a cluster placement group can use up to 5 Gbps for single-flow traffic.
 - Traffic to and from Amazon S3 buckets within the same Region over the public IP address space or through a VPC endpoint can use all available instance aggregate bandwidth.
- You can launch multiple instance types into a cluster placement group. However, this reduces the likelihood that the required capacity will be available for your launch to succeed. We recommend using the same instance type for all instances in a cluster placement group.
- Network traffic to the internet and over an AWS Direct Connect connection to on-premises resources is limited to 5 Gbps.

Partition placement group rules and limitations

The following rules apply to partition placement groups:

- A partition placement group supports a maximum of seven partitions per Availability Zone. The number of instances that you can launch in a partition placement group is limited only by your account limits.
- When instances are launched into a partition placement group, Amazon EC2 tries to evenly distribute the instances across all partitions. Amazon EC2 doesn't guarantee an even distribution of instances across all partitions.
- A partition placement group with Dedicated Instances can have a maximum of two partitions.
- Capacity Reservations do not reserve capacity in a partition placement group.

Spread placement group rules and limitations

The following rules apply to spread placement groups:

- A rack spread placement group supports a maximum of seven running instances per Availability Zone. For example, in a Region with three Availability Zones, you can run a total of 21 instances in the group, with seven instances in each Availability Zone. If you try to start an eighth instance in the same Availability Zone and in the same spread placement group, the instance will not launch. If you need more than seven instances in an Availability Zone, we recommend that you use multiple spread placement groups. Using multiple spread placement groups does not provide guarantees about the spread of instances between groups, but it does help ensure the spread for each group, thus limiting the impact from certain classes of failures.
- Spread placement groups are not supported for Dedicated Instances.
- Host level spread placement groups are only supported for placement groups on AWS Outposts. There are no restrictions for the number of running instances with host level spread placement groups.
- Capacity Reservations do not reserve capacity in a spread placement group.

Working with placement groups

Contents

- [Create a placement group \(p. 1357\)](#)
- [Tag a placement group \(p. 1358\)](#)
- [Launch instances in a placement group \(p. 1360\)](#)

- [Describe instances in a placement group \(p. 1361\)](#)
- [Change the placement group for an instance \(p. 1363\)](#)
- [Delete a placement group \(p. 1364\)](#)

Create a placement group

You can create a placement group using one of the following methods.

Note

You can tag a placement group on creation using the command line tools only.

Console

To create a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**, **Create placement group**.
3. Specify a name for the group.
4. Choose the placement strategy for the group. If you choose **Partition**, choose the number of partitions within the group.

Choose the placement strategy for the group.
 - If you choose **Spread**, choose the spread level.
 - Rack - no restrictions
 - Host - only for Outposts
 - If you choose **Partition**, choose the number of partitions within the group.
5. To tag the placement group, choose **Add tag**, and then enter a key and value. Choose **Add tag** for each tag that you want to add.
6. Choose **Create group**.

AWS CLI

To create a placement group using the AWS CLI

Use the [create-placement-group](#) command. The following example creates a placement group named *my-cluster* that uses the *cluster* placement strategy, and it applies a tag with a key of *purpose* and a value of *production*.

```
aws ec2 create-placement-group --group-name my-cluster --strategy cluster --tag-specifications 'ResourceType=placement-group,Tags=[{Key=purpose,Value=production}]'
```

To create a partition placement group using the AWS CLI

Use the [create-placement-group](#) command. Specify the **--strategy** parameter with the value **partition**, and specify the **--partition-count** parameter with the desired number of partitions. In this example, the partition placement group is named *HDFS-Group-A* and is created with five partitions.

```
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --partition-count 5
```

PowerShell

To create a placement group using the AWS Tools for Windows PowerShell

Use the [New-EC2PlacementGroup](#) command.

Tag a placement group

To help categorize and manage your existing placement groups, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

When you tag a placement group, the instances that are launched into the placement group are not automatically tagged. You need to explicitly tag the instances that are launched into the placement group. For more information, see [Add a tag when you launch an instance \(p. 2093\)](#).

You can view, add, and delete tags using the *new* console and the command line tools.

New console

You can view, add, and delete tags using one of the following methods.

Console

To view, add, or delete a tag for an existing placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
3. In the navigation pane, choose **Placement Groups**.
4. Select a placement group, and then choose **Actions, Manage tags**.
5. The **Manage tags** section displays any tags that are assigned to the placement group. Do the following to add or remove tags:
 - To add a tag, choose **Add tag**, and then enter the tag key and value. You can add up to 50 tags per placement group. For more information, see [Tag restrictions \(p. 2089\)](#).
 - To delete a tag, choose **Remove** next to the tag that you want to delete.
6. Choose **Save changes**.

AWS CLI

To view placement group tags

Use the [describe-tags](#) command to view the tags for the specified resource. In the following example, you describe the tags for all of your placement groups.

```
aws ec2 describe-tags \
    --filters Name=resource-type,Values=placement-group
```

```
{
    "Tags": [
        {
            "Key": "Environment",
            "ResourceId": "pg-0123456789EXAMPLE",
            "ResourceType": "placement-group",
            "Value": "Production"
        },
        {
            "Key": "Environment",
            "ResourceId": "pg-9876543210EXAMPLE",
            "ResourceType": "placement-group",
            "Value": "Production"
        }
    ]
}
```

```
        ]  
    }  
}
```

You can also use the [describe-tags](#) command to view the tags for a placement group by specifying its ID. In the following example, you describe the tags for pg-0123456789EXAMPLE.

```
aws ec2 describe-tags \  
  --filters Name=resource-id,Values=pg-0123456789EXAMPLE
```

```
{  
  "Tags": [  
    {  
      "Key": "Environment",  
      "ResourceId": "pg-0123456789EXAMPLE",  
      "ResourceType": "placement-group",  
      "Value": "Production"  
    }  
  ]  
}
```

You can also view the tags of a placement group by describing the placement group.

Use the [describe-placement-groups](#) command to view the configuration of the specified placement group, which includes any tags that were specified for the placement group.

```
aws ec2 describe-placement-groups \  
  --group-name my-cluster
```

```
{  
  "PlacementGroups": [  
    {  
      "GroupName": "my-cluster",  
      "State": "available",  
      "Strategy": "cluster",  
      "GroupId": "pg-0123456789EXAMPLE",  
      "Tags": [  
        {  
          "Key": "Environment",  
          "Value": "Production"  
        }  
      ]  
    }  
  ]  
}
```

To tag an existing placement group using the AWS CLI

You can use the [create-tags](#) command to tag existing resources. In the following example, the existing placement group is tagged with Key=Cost-Center and Value=CC-123.

```
aws ec2 create-tags \  
  --resources pg-0123456789EXAMPLE \  
  --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a placement group using the AWS CLI

You can use the [delete-tags](#) command to delete tags from existing resources. For examples, see [Examples](#) in the *AWS CLI Command Reference*.

PowerShell

To view placement group tags

Use the [Get-EC2Tag](#) command.

To describe the tags for a specific placement group

Use the [Get-EC2PlacementGroup](#) command.

To tag an existing placement group

Use the [New-EC2Tag](#) command.

To delete a tag from a placement group

Use the [Remove-EC2Tag](#) command.

Launch instances in a placement group

You can launch an instance into a placement group if the [placement group rules and limitations are met \(p. 1356\)](#) using one of the following methods.

Console

To launch instances into a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the EC2 console dashboard, in the **Launch instance** box, choose **Launch instance**, and then choose **Launch instance** from the options that appear. Complete the form as directed, taking care to do the following:
 - Under **Instance type**, select an instance type that can be launched into a placement group.
 - In the **Summary** box, under **Number of instances**, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
 - Under **Advanced details**, for **Placement group name**, you can choose to add the instances to a new or existing placement group. If you choose a placement group with a partition strategy, for **Target partition**, choose the partition in which to launch the instances.

Old Console

To launch instances into a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Choose **Launch Instance**. Complete the wizard as directed, taking care to do the following:

From the EC2 console dashboard, in the **Launch instance** box, choose **Launch instance**, and then choose **Launch instance** from the options that appear. Complete the wizard as directed, taking care to do the following:

- On the **Choose an Instance Type** page, select an instance type that can be launched into a placement group.

- On the **Configure Instance Details** page, the following fields are applicable to placement groups:
 - For **Number of instances**, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
 - For **Placement group**, select the **Add instance to placement group** check box. If you do not see **Placement group** on this page, verify that you have selected an instance type that can be launched into a placement group. Otherwise, this option is not available.
 - For **Placement group name**, you can choose to add the instances to an existing placement group or to a new placement group that you create.
 - For **Placement group strategy**, choose the appropriate strategy. If you choose **partition**, for **Target partition**, choose **Auto distribution** to have Amazon EC2 do a best effort to distribute the instances evenly across all the partitions in the group. Alternatively, specify the partition in which to launch the instances.

AWS CLI

To launch instances into a placement group using the AWS CLI

Use the [run-instances](#) command and specify the placement group name using the `--placement "GroupName = my-cluster"` parameter. In this example, the placement group is named my-cluster.

```
aws ec2 run-instances --placement "GroupName = my-cluster"
```

To launch instances into a specific partition of a partition placement group using the AWS CLI

Use the [run-instances](#) command and specify the placement group name and partition using the `--placement "GroupName = HDFS-Group-A, PartitionNumber = 3"` parameter. In this example, the placement group is named HDFS-Group-A and the partition number is 3.

```
aws ec2 run-instances --placement "GroupName = HDFS-Group-A, PartitionNumber = 3"
```

PowerShell

To launch instances into a placement group using AWS Tools for Windows PowerShell

Use the [New-EC2Instance](#) command and specify the placement group name using the `-Placement_GroupName` parameter.

Describe instances in a placement group

You can view the placement information of your instances using one of the following methods. You can also filter partition placement groups by the partition number using the AWS CLI.

Console

To view the placement group and partition number of an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Details** tab, under **Host and placement group**, find **Placement group**. If the instance is not in a placement group, the field is empty. Otherwise, it contains the name of the placement

group name. If the placement group is a partition placement group, **Partition number** contains the partition number for the instance.

AWS CLI

To view the partition number for an instance in a partition placement group using the AWS CLI

Use the [describe-instances](#) command and specify the --instance-id parameter.

```
aws ec2 describe-instances --instance-id i-0123a456700123456
```

The response contains the placement information, which includes the placement group name and the partition number for the instance.

```
"Placement": {  
    "AvailabilityZone": "us-east-1c",  
    "GroupName": "HDFS-Group-A",  
    "PartitionNumber": 3,  
    "Tenancy": "default"  
}
```

To filter instances for a specific partition placement group and partition number using the AWS CLI

Use the [describe-instances](#) command and specify the --filters parameter with the placement-group-name and placement-partition-number filters. In this example, the placement group is named HDFS-Group-A and the partition number is 7.

```
aws ec2 describe-instances --filters "Name = placement-group-name, Values = HDFS-Group-A" "Name = placement-partition-number, Values = 7"
```

The response lists all the instances that are in the specified partition within the specified placement group. The following is example output showing only the instance ID, instance type, and placement information for the returned instances.

```
"Instances": [  
    {  
        "InstanceId": "i-0a1bc23d4567e8f90",  
        "InstanceType": "r4.large",  
        },  
  
        "Placement": {  
            "AvailabilityZone": "us-east-1c",  
            "GroupName": "HDFS-Group-A",  
            "PartitionNumber": 7,  
            "Tenancy": "default"  
        }  
  
        {  
            "InstanceId": "i-0a9b876cd5d4ef321",  
            "InstanceType": "r4.large",  
            },  
  
            "Placement": {  
                "AvailabilityZone": "us-east-1c",  
                "GroupName": "HDFS-Group-A",  
                "PartitionNumber": 7,  
                "Tenancy": "default"  
            }  
    ],
```

Change the placement group for an instance

You can change the placement group for an instance in any of the following ways:

- Move an existing instance to a placement group
- Move an instance from one placement group to another
- Remove an instance from a placement group

Before you move or remove the instance, the instance must be in the stopped state. You can move or remove an instance using the AWS CLI or an AWS SDK.

AWS CLI

To move an instance to a placement group using the AWS CLI

1. Stop the instance using the [stop-instances](#) command.
2. Use the [modify-instance-placement](#) command and specify the name of the placement group to which to move the instance.

```
aws ec2 modify-instance-placement --instance-id i-0123a456700123456 --group-name MySpreadGroup
```
3. Start the instance using the [start-instances](#) command.

PowerShell

To move an instance to a placement group using the AWS Tools for Windows PowerShell

1. Stop the instance using the [Stop-EC2Instance](#) command.
2. Use the [Edit-EC2InstancePlacement](#) command and specify the name of the placement group to which to move the instance.
3. Start the instance using the [Start-EC2Instance](#) command.

AWS CLI

To remove an instance from a placement group using the AWS CLI

1. Stop the instance using the [stop-instances](#) command.
2. Use the [modify-instance-placement](#) command and specify an empty string for the placement group name.

```
aws ec2 modify-instance-placement --instance-id i-0123a456700123456 --group-name ""
```
3. Start the instance using the [start-instances](#) command.

PowerShell

To remove an instance from a placement group using the AWS Tools for Windows PowerShell

1. Stop the instance using the [Stop-EC2Instance](#) command.

2. Use the [Edit-EC2InstancePlacement](#) command and specify an empty string for the placement group name.
3. Start the instance using the [Start-EC2Instance](#) command.

Delete a placement group

If you need to replace a placement group or no longer need one, you can delete it. You can delete a placement group using one of the following methods.

Requirement

Before you can delete a placement group, it must contain no instances. You can [terminate \(p. 617\)](#) all instances that you launched in the placement group, [move \(p. 1363\)](#) instances to another placement group, or [remove \(p. 1363\)](#) instances from the placement group.

Console

To delete a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. Select the placement group and choose **Actions, Delete**.
4. When prompted for confirmation, enter **Delete** and then choose **Delete**.

AWS CLI

To delete a placement group using the AWS CLI

Use the [delete-placement-group](#) command and specify the placement group name to delete the placement group. In this example, the placement group name is *my-cluster*.

```
aws ec2 delete-placement-group --group-name my-cluster
```

PowerShell

To delete a placement group using the AWS Tools for Windows PowerShell

Use the [Remove-EC2PlacementGroup](#) command to delete the placement group.

Share a placement group

Placement group sharing allows you to influence the placement of interdependent instances that are owned by separate AWS accounts. You can share a placement group across multiple AWS accounts or within your AWS Organizations. You can launch instances in a shared placement group.

A placement group owner can share a placement group with:

- Specific AWS accounts inside or outside of its AWS organization
- An organizational unit inside its AWS organization
- Its entire AWS organization

Note

The AWS account from which you want to share a placement group must have the following permissions in the IAM policy.

- ec2:PutResourcePolicy
- ec2:DeleteResourcePolicy

Topics

- [Rules and limitations \(p. 1365\)](#)
- [Share across Availability Zones \(p. 1365\)](#)
- [Share a placement group \(p. 1365\)](#)
- [Identify a shared placement group \(p. 1366\)](#)
- [Launch an instance in a shared placement group \(p. 1366\)](#)
- [Unshare a shared placement group \(p. 1367\)](#)

Rules and limitations

The following rules and limitations apply when you share a placement group or when a placement group is shared with you.

- To share a placement group, you must own it in your AWS account. You cannot share a placement group that has been shared with you.
- When you share a partition or spread placement group, the placement group limits do not change. A shared partition placement group supports a maximum of seven partitions per Availability Zone, and a shared spread placement group supports a maximum of seven running instances per Availability Zone.
- To share a placement group with your AWS organization or an organizational unit in your AWS organization, you must enable sharing with AWS Organizations. For more information, see [Sharing your AWS resources](#).
- You are responsible for managing the instances owned by you in a shared placement group.
- You cannot view or modify instances and capacity reservations that are associated with a shared placement group but not owned by you.

Share across Availability Zones

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to names for each account. This could lead to Availability Zone naming differences across accounts. For example, the Availability Zone us-east-1a for your AWS account might not have the same location as us-east-1a for another AWS account.

To identify the location of your Dedicated Hosts relative to your accounts, you must use the *Availability Zone ID* (AZ ID). The Availability Zone ID is a unique and consistent identifier for an Availability Zone across all AWS accounts. For example, use1-az1 is an Availability Zone ID for the us-east-1 Region and it is the same location in every AWS account.

To view the Availability Zone IDs for the Availability Zones in your account:

1. Open the AWS RAM console at <https://console.aws.amazon.com/ram>.
2. The Availability Zone IDs for the current Region are displayed under **Your AZ ID** in the right panel.

Share a placement group

To share a placement group, you must add it to a resource share. A resource share is an AWS RAM resource that lets you share your resources across AWS accounts. A resource share specifies the resources to share, and the consumers with whom they are shared.

If you are part of an organization in AWS Organizations sharing within your organization is enabled, consumers in your organization are granted access to the shared placement group.

If the placement group is shared with an AWS account outside of your organization, the AWS account owner will receive an invitation to join the resource share. They can access the shared placement group after accepting the invitation.

You can share a placement group across AWS accounts using <https://console.aws.amazon.com/ram> or AWS CLI.

AWS RAM console

To **share a placement group** you own using <https://console.aws.amazon.com/ram>, see [Creating a resource share](#).

AWS CLI

To **share a placement group** you own, use the [create-resource-share](#) command.

Identify a shared placement group

You can identify a placement group shared that is shared with you via <https://console.aws.amazon.com/ec2/> or AWS CLI.

Amazon EC2 console

1. Open <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Placement Groups**.
3. The **Placement Groups** screen on the right lists all the placement groups owned by you and shared with you. The **Amazon Resource Name (ARN)** of a placement group contains the details of its owner.

AWS CLI

The [describe-placement-groups](#) command lists all the placement groups owned by you and shared with you. The **Amazon Resource Name (ARN)** of a placement group contains the details of its owner.

Launch an instance in a shared placement group

Important

You must specify the Placement Group **Group Id** to launch an instance in a shared placement group.

You can use the Placement Group Name only if you are the owner of the placement group being shared. We recommend using the Placement Group **Group Id** to avoid potential placement group name collisions between AWS accounts.

You can find the Group Id of a placement group using the [describe-placement-groups](#) command or in the <https://console.aws.amazon.com/ec2/> on the **Placement Groups** screen under **Network & Security**.

Amazon EC2 Console

To launch instances into a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Choose **Launch Instance**. Complete the wizard as directed, taking care to do the following:
 - On the **Choose an Instance Type** page, select an instance type that can be launched into a placement group.
 - On the **Configure Instance Details** page, the following fields are applicable to placement groups:
 - For **Number of instances**, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
 - For **Placement group**, select the **Add instance to placement group** check box. If you do not see **Placement group** on this page, verify that you have selected an instance type that can be launched into a placement group. Otherwise, this option is not available.
 - For **Placement group name**, you can choose to add the instances to an existing placement group or to a new placement group that you create.
 - For **Placement group strategy**, choose the appropriate strategy. If you choose **partition**, for **Target partition**, choose **Auto distribution** to have Amazon EC2 do a best effort to distribute the instances evenly across all the partitions in the group. Alternatively, specify the partition in which to launch the instances.

AWS CLI

To launch instances in a shared placement group

Use the [run-instances](#) command and specify the placement group **GroupId**.

```
aws ec2 run-instances --placement "GroupId = pg-01234567891011121"
```

To launch instances into a specific partition of a shared partition placement group

Use the [run-instances](#) command and specify the **GroupId** and **PartitionNumber** of the shared placement group.

```
aws ec2 run-instances --placement "GroupId = pg-01234567891011121, PartitionNumber = 3"
```

Tip

Use VPC peering to connect instances owned by separate AWS accounts and get the full latency benefits offered by shared cluster placement groups. For more information, see [What is VPC peering?](#)

Unshare a shared placement group

The placement group owner can unshare a shared placement group at any time.

When you unshare a shared placement group, the following changes will take effect.

- The AWS accounts with which a placement group was shared will no longer be able to launch instances or reserve capacity.
- If your instances were running in a shared placement group, they will be disassociated from the placement group but continue to run normally in your AWS account.
- If you had capacity reservations in a shared placement group, they will be disassociated from the placement group but you will continue to have access to them in your AWS account.

You can unshare a shared placement group using one of the following methods.

AWS RAM console

To unshare a shared placement group using <https://console.aws.amazon.com/ram>, see [Deleting a resource share](#).

AWS CLI

To unshare a shared placement group using AWS Command Line Interface, use the [disassociate-resource-share](#) command.

Placement groups on AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region.

You can create placement groups on Outposts that you have created in your account. This allows you to spread out instances across underlying hardware on an Outpost at your site. You create and use placement groups on Outposts in the same way that you create and use placement groups in regular Availability Zones. When you create a placement group with a spread strategy on an Outpost, you can choose to have the placement group spread instances across hosts or racks. Spreading instances across hosts allows you to use a spread strategy with a single rack Outpost.

Prerequisite

You must have an Outpost installed at your site. For more information, see [Create an Outpost and order Outpost capacity](#) in the *AWS Outposts User Guide*.

To use a placement group on an Outpost

1. Create a subnet on the Outpost. For more information, see [Create a subnet](#) in the *AWS Outposts User Guide*.
2. Create a placement group in the associated Region of the Outpost. If you create a placement group with a spread strategy, you can choose host or rack spread level to determine how the group will spread instances across the underlying hardware on your Outpost. For more information, see [the section called "Create a placement group" \(p. 1357\)](#).
3. Launch an instance into the placement group. For **Subnet** choose the subnet that you created in Step 1, and for **Placement group name**, select the placement group that you created in Step 2. For more information, see [Launch an instance on the Outpost](#) in the *AWS Outposts User Guide*.

Network maximum transmission unit (MTU) for your EC2 instance

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The larger the MTU of a connection, the more data that can be passed in a single packet. Ethernet frames consist of the packet, or the actual data you are sending, and the network overhead information that surrounds it.

Ethernet frames can come in different formats, and the most common format is the standard Ethernet v2 frame format. It supports 1500 MTU, which is the largest Ethernet packet size supported over most of the internet. The maximum supported MTU for an instance depends on its instance type.

The following rules apply to instances that are in Wavelength Zones:

- Traffic that goes from one instance to another within a VPC in the same Wavelength Zone has an MTU of 1300.
- Traffic that goes from one instance to another that uses the carrier IP within a Wavelength Zone has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a public IP address has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a private IP address has an MTU of 1300.

To see Network MTU information for Linux instances, switch to this page in the *Amazon EC2 User Guide for Linux Instances* guide: [Network maximum transmission unit \(MTU\) for your EC2 instance](#).

Contents

- [Jumbo frames \(9001 MTU\) \(p. 1369\)](#)
- [Path MTU Discovery \(p. 1370\)](#)
- [Check the path MTU between two hosts \(p. 1370\)](#)
- [Check and set the MTU on your Windows instance \(p. 1371\)](#)
- [Troubleshoot \(p. 1372\)](#)

Jumbo frames (9001 MTU)

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, and thus increasing the percentage of the packet that is not packet overhead. Fewer packets are needed to send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic over an internet gateway
- Traffic over an inter-region VPC peering connection
- Traffic over VPN connections
- Traffic outside of a given AWS Region for EC2-Classic

If packets are over 1500 bytes, they are fragmented, or they are dropped if the Don't Fragment flag is set in the IP header.

Jumbo frames should be used with caution for internet-bound traffic or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside a VPC and not slow traffic that's bound for outside the VPC, you can configure the MTU size by route, or use multiple elastic network interfaces with different MTU sizes and different routes.

For instances that are collocated inside a cluster placement group, jumbo frames help to achieve the maximum network throughput possible, and they are recommended in this case. For more information, see [Placement groups \(p. 1352\)](#).

You can use jumbo frames for traffic between your VPCs and your on-premises networks over AWS Direct Connect. For more information, and for how to verify Jumbo Frame capability, see [Setting Network MTU](#) in the *AWS Direct Connect User Guide*.

All Amazon EC2 instance types support 1500 MTU and all [current generation instance types \(p. 220\)](#) support jumbo frames. The following previous generation instance types support jumbo frames: A1, C3, G2, I2, M3, and R3.

For more information about supported MTU sizes for transit gateways, see [MTU](#) in *Amazon VPC Transit Gateways*.

Path MTU Discovery

Path MTU Discovery (PMTUD) is used to determine the path MTU between two devices. The path MTU is the maximum packet size that's supported on the path between the originating host and the receiving host. When there is a difference in the MTU size in the network between two hosts, PMTUD enables the receiving host to respond to the originating host with an ICMP message. This ICMP message instructs the originating host to use the lowest MTU size along the network path and to resend the request. Without this negotiation, packet drop can occur because the request is too large for the receiving host to accept.

For IPv4, when a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

The IPv6 protocol does not support fragmentation in the network. When a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: ICMPv6 Packet Too Big (PTB) (Type 2). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

Connections made through some components, like NAT gateways and load balancers, are [automatically tracked \(p. 1678\)](#). This means that [security group tracking \(p. 1677\)](#) is automatically enabled for your outbound connection attempts. If connections are automatically tracked or if your security group rules allow inbound ICMP traffic, you can receive PMTUD responses.

Note that ICMP traffic can be blocked even if the traffic is allowed at the security group level, such as if you have a network access control list entry that denies ICMP traffic to the subnet.

Important

Path MTU Discovery does not guarantee that jumbo frames will not be dropped by some routers. An internet gateway in your VPC will forward packets up to 1500 bytes only. 1500 MTU packets are recommended for internet traffic.

Check the path MTU between two hosts

You can check the path MTU between two hosts using the **mturoute.exe** command, which you can download and install from <http://www.elifulkerson.com/projects/mturoute.php>.

To check path MTU using mturoute.exe

1. Download **mturoute.exe** from <http://www.elifulkerson.com/projects/mturoute.php>.
2. Open a Command Prompt window and change to the directory where you downloaded **mturoute.exe**.
3. Use the following command to check the path MTU between your EC2 instance and another host. You can use a DNS name or an IP address as the destination. If the destination is another EC2 instance, verify that the security group allows inbound UDP traffic. This example checks the path MTU between an EC2 instance and www.elifulkerson.com.

```
.\mturoute.exe www.elifulkerson.com
* ICMP Fragmentation is not permitted. *
```

```
* Speed optimization is enabled.  
* Maximum payload is 10000 bytes.  
+ ICMP payload of 1472 bytes succeeded.  
- ICMP payload of 1473 bytes is too big.  
Path MTU: 1500 bytes.
```

In this example, the path MTU is 1500.

Check and set the MTU on your Windows instance

Some drivers are configured to use jumbo frames, and others are configured to use standard frame sizes. You might want to use jumbo frames for network traffic within your VPC or standard frames for internet traffic. Whatever your use case, we recommend that you verify that your instances behave as expected.

If your instance runs in a Wavelength Zone, the maximum MTU value is 1300.

ENA Driver

For Driver Versions 1.5 and Earlier

You can change the MTU setting using Device Manager or the **Set-NetAdapterAdvancedProperty** command.

To get the current MTU setting using the **Get-NetAdapterAdvancedProperty** command, use the following command. Check the entry for the interface name MTU. A value of 9001 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Enable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -RegistryValue 9001
```

Disable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -RegistryValue 1500
```

For Driver Versions 2.1.0 and Later

You can change the MTU setting using Device Manager or the **Set-NetAdapterAdvancedProperty** command.

To get the current MTU setting using the **Get-NetAdapterAdvancedProperty** command, use the following command. Check the entry for the interface name *JumboPacket. A value of 9015 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

Run **Get-NetAdapterAdvancedProperty** or use wildcard (asterisk) to detect all corresponding Ethernet names.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet*"
```

Run the following commands and include the Ethernet name you want to query.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Enable jumbo frames as follows.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 9015
```

Disable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 1514
```

Intel SRIOV 82599 driver

You can change the MTU setting using Device Manager or the **Set-NetAdapterAdvancedProperty** command.

To get the current MTU setting using the **Get-NetAdapterAdvancedProperty** command, use the following command. Check the entry for the interface name *JumboPacket. A value of 9014 indicates that Jumbo frames are enabled. (Note that the MTU size includes the header and the payload.) Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Enable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 9014
```

Disable jumbo frames as follows:

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -  
RegistryValue 1514
```

AWS PV driver

You cannot change the MTU setting using Device Manager, but you can change it using the **netsh** command.

Get the current MTU setting using the following command. The name of the interface can vary. In the output, look for an entry with the name "Ethernet," "Ethernet 2," or "Local Area Connection". You'll need the interface name to enable or disable jumbo frames. A value of 9001 indicates that Jumbo frames are enabled.

```
netsh interface ipv4 show subinterface
```

Enable jumbo frames as follows:

```
netsh interface ipv4 set subinterface "Ethernet" mtu=9001
```

Disable jumbo frames as follows:

```
netsh interface ipv4 set subinterface "Ethernet" mtu=1500
```

Troubleshoot

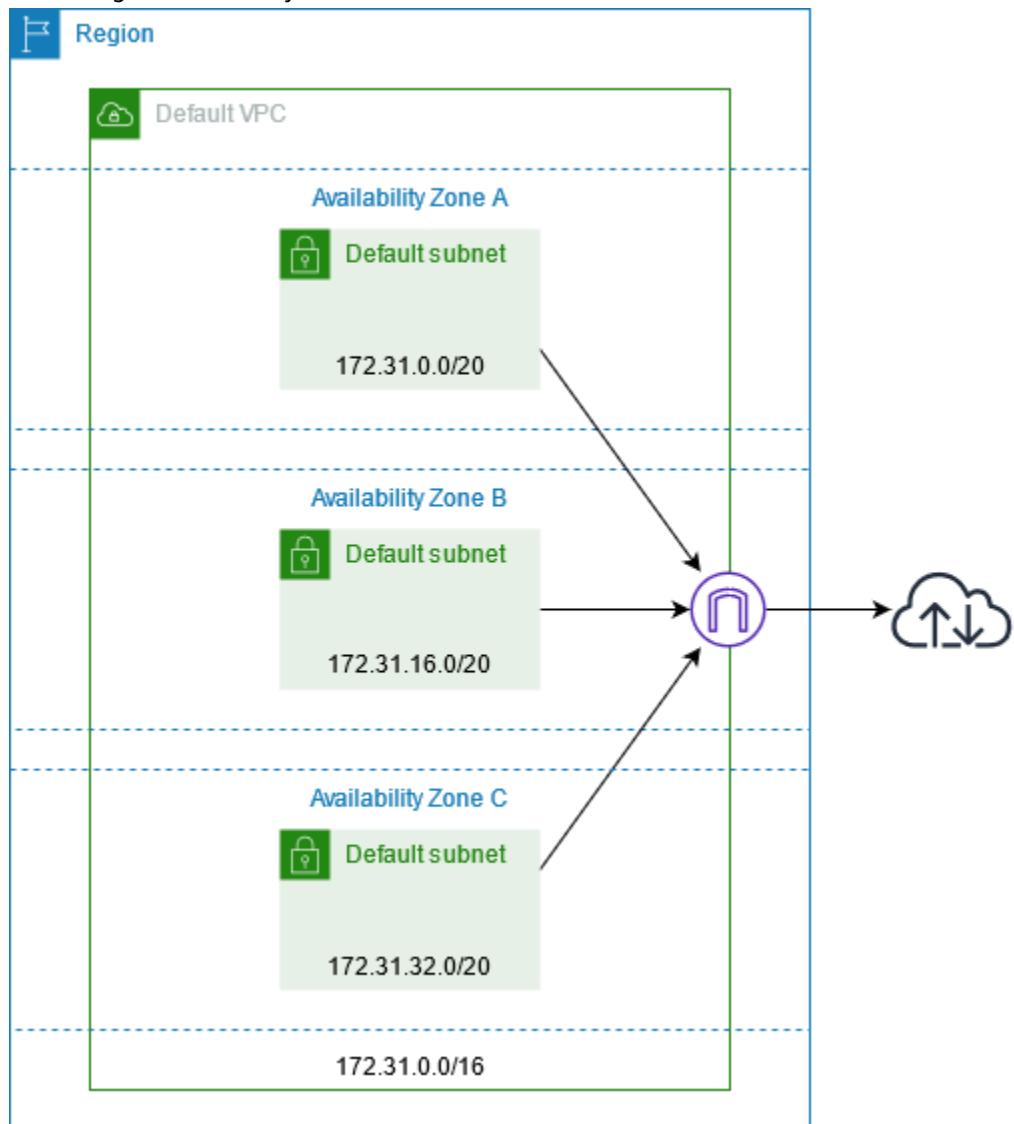

If you experience connectivity issues between your EC2 instance and an Amazon Redshift cluster when using jumbo frames, see [Queries Appear to Hang](#) in the *Amazon Redshift Management Guide*.

Virtual private clouds

Amazon Virtual Private Cloud (Amazon VPC) enables you to define a virtual network in your own logically isolated area within the AWS cloud, known as a *virtual private cloud* or *VPC*. You can create AWS resources, such as Amazon EC2 instances, into the subnets of your VPC. Your VPC closely resembles a traditional network that you might operate in your own data center, with the benefits of using scalable infrastructure from AWS. You can configure your VPC; you can select its IP address range, create subnets, and configure route tables, network gateways, and security settings. You can connect instances in your VPC to the internet or to your own data center.

Your default VPCs

When you create your AWS account, we create a *default VPC* in each Region. A default VPC is a VPC that is already configured and ready for you to use. For example, there is a default subnet for each Availability Zone in each default VPC, an internet gateway attached to the VPC, and there's a route in the main route table that sends all traffic (0.0.0.0/0) to the internet gateway. Alternatively, you can create your own VPC and configure it to meet your needs.

Create additional VPCs

Use the following procedure to create a VPC with the subnets, gateways, and routing configuration that you need.

To create a VPC

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. Choose **Create VPC**.
3. Under **Resources to create**, choose **VPC and more**.
4. For **Name tag auto-generation**, enter a name for the VPC.
5. For **IPv4 CIDR block**, either keep the default suggestion, enter the CIDR block required by your application or network.
6. For **Number of Availability Zones**, choose **2**, so that you can launch instances in multiple Availability Zones to ensure high availability.
7. If your instances must be accessible from the internet, do one of the following:
 - If your instances can be in a public subnet, select a nonzero value for **Number of public subnets**. Keep both options under **DNS options** selected. You can optionally add private subnets now or later on.
 - If your instances must be in a private subnet, select **0** for **Number of public subnets**. For **Number of private subnets**, select a number depending on your needs (the possible values correspond to 1 or 2 private subnets per Availability Zone). For **NAT gateways**, if your instances in both Availability Zones send or receive a significant volume of traffic across Availability Zones, select **1 per AZ**. Otherwise, select **In 1 AZ** and launch instances that send or receive cross-zone traffic in the same Availability Zone as the NAT gateway.
8. Expand **Customize subnet CIDR blocks**. Either keep the default suggestions, or enter a CIDR block for each subnet. For more information, see [Subnet CIDR blocks](#) in the *Amazon VPC User Guide*.
9. Review the **Preview** pane, which shows the VPC resources that will be created based on your selections.
10. Choose **Create VPC**.

Access the internet from your instances

Instances launched into a default subnet have access to the internet, as the VPC is configured to assign public IP addresses and DNS hostnames, and the main route table is configured with a route to an internet gateway attached to the VPC.

For the subnets that you create in your VPCs, do one of the following to ensure that instances that you launch in these subnets have access to the internet:

- Configure an internet gateway. For more information, see [Connect to the internet using an internet gateway](#) in the *Amazon VPC User Guide*.
- Configure a public NAT gateway. For more information, see [Access the internet from a private subnet](#) in the *Amazon VPC User Guide*.

Shared subnets

When launching EC2 instances into shared VPC subnets, note the following:

- Participants can run instances in a shared VPC subnet by passing in the shared subnet ID. If participants want to pass in a security group ID or network interface ID when they run an instance, the participant must own the security group or network interface.

- Participants can start, stop, terminate, and describe instances that they've created in a shared VPC subnet. Participants cannot start, stop, terminate, or describe instances created by the VPC owner in a shared VPC subnet.
- VPC owners cannot start, stop, terminate, or describe instances created by participants in a shared VPC subnet.

For more information see, [Share your VPC with other accounts](#) in the *Amazon VPC User Guide*.

RDP access to your instances

To connect to an instance, you must authorize RDP traffic to the instance from your network. You must also specify a key pair when you launch the instance and specify the .pem file when you connect to the instance. For more information, see [Prerequisites \(p. 627\)](#).

Ports and Protocols for Windows Amazon Machine Images (AMIs)

The following tables list the ports, protocols, and directions by workload for Windows Amazon Machine Images.

For more information about Amazon EC2 security groups, see [Amazon EC2 Security Groups for Windows Instances](#).

Code examples for Amazon EC2 using AWS SDKs

The following code examples show how to use Amazon EC2 with an AWS software development kit (SDK).

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

For a complete list of AWS SDK developer guides and code examples, see [Using this service with an AWS SDK \(p. 27\)](#). This topic also includes information about getting started and details about previous SDK versions.

Get started

Hello Amazon EC2

The following code examples show how to get started using Amazon EC2.

.NET

AWS SDK for .NET

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
namespace EC2Actions;

public class HelloEc2
{
    /// <summary>
    /// HelloEc2 lists the existing security groups for the default users.
    /// </summary>
    /// <param name="args">Command line arguments</param>
    /// <returns>A Task object.</returns>
    static async Task Main(string[] args)
    {
        // Set up dependency injection for Amazon Elastic Compute Cloud (Amazon
        EC2).
        using var host =
            Microsoft.Extensions.Hosting.Host.CreateDefaultBuilder(args)
                .ConfigureServices(_,
                    services =>
                        services.AddAWSService<IAmazonEC2>()
                            .AddTransient<EC2Wrapper>()
                )
    }
}
```

```
.Build();

// Now the client is available for injection.
var ec2Client = host.Services.GetRequiredService<IAmazonEC2>();

var request = new DescribeSecurityGroupsRequest
{
    MaxResults = 10,
};

// Retrieve information about up to 10 Amazon EC2 security groups.
var response = await ec2Client.DescribeSecurityGroupsAsync(request);

// Now print the security groups returned by the call to
// DescribeSecurityGroupsAsync.
Console.WriteLine("Security Groups:");
response.SecurityGroups.ForEach(group =>
{
    Console.WriteLine($"Security group: {group.GroupName} ID:
{group.GroupId}");
});
}
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for .NET API Reference*.

C++

SDK for C++

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS ec2)

# Set this project's name.
project("hello_ec2")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

Actions for Amazon EC2 using AWS SDKs

The following code examples demonstrate how to perform individual Amazon EC2 actions with AWS SDKs. These excerpts call the Amazon EC2 API and are code excerpts from larger programs that must be run in context. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

The following examples include only the most commonly used actions. For a complete list, see the [Amazon Elastic Compute Cloud \(Amazon EC2\) API Reference](#).

Examples

- [Add tags to Amazon EC2 resources using an AWS SDK \(p. 1426\)](#)
- [Allocate an Elastic IP address for Amazon EC2 using an AWS SDK \(p. 1427\)](#)
- [Associate an Elastic IP address with an Amazon EC2 instance using an AWS SDK \(p. 1431\)](#)
- [Create an Amazon EC2 security group using an AWS SDK \(p. 1435\)](#)
- [Create a security key pair for Amazon EC2 using an AWS SDK \(p. 1440\)](#)
- [Create and run an Amazon EC2 instance using an AWS SDK \(p. 1445\)](#)
- [Delete an Amazon EC2 security group using an AWS SDK \(p. 1450\)](#)
- [Delete an Amazon EC2 security key pair using an AWS SDK \(p. 1454\)](#)
- [Delete the Amazon EBS snapshot using an AWS SDK \(p. 1458\)](#)
- [Describe the Availability Zones for your account using an AWS SDK \(p. 1459\)](#)
- [Describes the Regions for your account using an AWS SDK \(p. 1460\)](#)
- [Describes the status of Amazon EC2 instances using an AWS SDK \(p. 1462\)](#)
- [Describe Amazon EC2 instances using an AWS SDK \(p. 1463\)](#)
- [Describe one or more Amazon EBS snapshots using an AWS SDK \(p. 1470\)](#)
- [Disable detailed monitoring for an Amazon EC2 instance using an AWS SDK \(p. 1472\)](#)
- [Disassociate an Elastic IP address from an Amazon EC2 instance using an AWS SDK \(p. 1473\)](#)
- [Enables monitoring for a running Amazon EC2 instance using an AWS SDK \(p. 1476\)](#)
- [Get data about Amazon Machine Images using an AWS SDK \(p. 1479\)](#)
- [Get data about an Amazon EC2 security group using an AWS SDK \(p. 1481\)](#)
- [Get data about Amazon EC2 instance types using an AWS SDK \(p. 1486\)](#)
- [Get details about Elastic IP addresses using an AWS SDK \(p. 1490\)](#)
- [List Amazon EC2 security key pairs using an AWS SDK \(p. 1492\)](#)
- [Reboot an Amazon EC2 instance using an AWS SDK \(p. 1496\)](#)
- [Release an Elastic IP address using an AWS SDK \(p. 1499\)](#)
- [Set inbound rules for an Amazon EC2 security group using an AWS SDK \(p. 1502\)](#)
- [Start an Amazon EC2 instance using an AWS SDK \(p. 1508\)](#)

Add tags to Amazon EC2 resources using an AWS SDK

The following code example shows how to add tags to Amazon EC2 resources.

C++

SDK for C++

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::EC2::EC2Client ec2Client(clientConfiguration);

Aws::EC2::Model::Tag nameTag;
nameTag.SetKey("Name");
nameTag.SetValue(instanceName);

Aws::EC2::Model::CreateTagsRequest createRequest;
createRequest.AddResources(instanceID);
createRequest.AddTags(nameTag);

Aws::EC2::Model::CreateTagsOutcome createOutcome = ec2Client.CreateTags(
    createRequest);
if (!createOutcome.IsSuccess()) {
    std::cerr << "Failed to tag ec2 instance " << instanceID <<
        " with name " << instanceName << ":" <<
        createOutcome.GetError().GetMessage() << std::endl;
    return false;
}
```

- For API details, see [CreateTags](#) in *AWS SDK for C++ API Reference*.

- For API details, see [TerminateInstances](#) in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see [Using this service with an AWS SDK \(p. 27\)](#). This topic also includes information about getting started and details about previous SDK versions.

Scenarios for Amazon EC2 using AWS SDKs

The following code examples show you how to implement common scenarios in Amazon EC2 with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within Amazon EC2. Each scenario includes a link to GitHub, where you can find instructions on how to set up and run the code.

Examples

- [Get started with Amazon EC2 instances using an AWS SDK \(p. 1522\)](#)

Get started with Amazon EC2 instances using an AWS SDK

The following code examples show how to:

- Create a key pair and security group.
- Select an Amazon Machine Image (AMI) and compatible instance type, then create an instance.
- Stop and restart the instance.
- Associate an Elastic IP address with your instance.
- Connect to your instance with SSH, then clean up resources.

.NET

AWS SDK for .NET

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run a scenario at a command prompt.

```

Java

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this Java (v2) code example, set up your development environment,  
 * including your credentials.  
 *  
 * For more information, see the following documentation topic:  
 *  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
 *  
 * This Java example performs the following tasks:  
 *  
 * 1. Creates an RSA key pair and saves the private key data as a .pem file.  
 * 2. Lists key pairs.  
 * 3. Creates a security group for the default VPC.  
 * 4. Displays security group information.  
 * 5. Gets a list of Amazon Linux 2 AMIs and selects one.  
 * 6. Gets more information about the image.  
 * 7. Gets a list of instance types that are compatible with the selected AMI's  
 * architecture.  
 * 8. Creates an instance with the key pair, security group, AMI, and an instance  
 * type.  
 * 9. Displays information about the instance.  
 * 10. Stops the instance and waits for it to stop.  
 * 11. Starts the instance and waits for it to start.  
 * 12. Allocates an Elastic IP address and associates it with the instance.  
 * 13. Displays SSH connection info for the instance.  
 * 14. Disassociates and deletes the Elastic IP address.  
 * 15. Terminates the instance and waits for it to terminate.  
 * 16. Deletes the security group.  
 * 17. Deletes the key pair.

Kotlin

SDK for Kotlin

Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
Before running this Kotlin code example, set up your development environment,  
including your credentials.  
  
For more information, see the following documentation topic:  
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html  
  
This Kotlin example performs the following tasks:  
  
1. Creates an RSA key pair and saves the private key data as a .pem file.  
2. Lists key pairs.  
3. Creates a security group for the default VPC.  
4. Displays security group information.  
5. Gets a list of Amazon Linux 2 AMIs and selects one.  
6. Gets more information about the image.  
7. Gets a list of instance types that are compatible with the selected AMI's  
architecture.  
8. Creates an instance with the key pair, security group, AMI, and an instance  
type.  
9. Displays information about the instance.  
10. Stops the instance and waits for it to stop.  
11. Starts the instance and waits for it to start.  
12. Allocates an Elastic IP address and associates it with the instance.  
13. Displays SSH connection info for the instance.  
14. Disassociates and deletes the Elastic IP address.  
15. Terminates the instance.  
16. Deletes the security group.  
17. Deletes the key pair.  
*/

Security in Amazon EC2

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The [shared responsibility model](#) describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS Compliance Programs](#). To learn about the compliance programs that apply to Amazon EC2, see [AWS Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility includes the following areas:
 - Controlling network access to your instances, for example, through configuring your VPC and security groups. For more information, see [Controlling network traffic \(p. 1579\)](#).
 - Managing the credentials used to connect to your instances.
 - Managing the guest operating system and software deployed to the guest operating system, including updates and security patches. For more information, see [Update management in Amazon EC2 \(p. 1694\)](#).
 - Configuring the IAM roles that are attached to the instance and the permissions associated with those roles. For more information, see [IAM roles for Amazon EC2 \(p. 1649\)](#).

This documentation helps you understand how to apply the shared responsibility model when using Amazon EC2. It shows you how to configure Amazon EC2 to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Amazon EC2 resources.

For security best practices for Amazon EC2 running Windows Server, see **Security and Network** under [Best practices for Windows on Amazon EC2 \(p. 23\)](#).

Infrastructure security in Amazon EC2

As a managed service, Amazon Elastic Compute Cloud is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see [AWS Cloud Security](#). To design your AWS environment using the best practices for infrastructure security, see [Infrastructure Protection](#) in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access Amazon EC2 through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

For more information, see [Infrastructure Protection](#) in the *Security Pillar – AWS Well-Architected Framework*.

Network isolation

A virtual private cloud (VPC) is a virtual network in your own logically isolated area in the AWS Cloud. Use separate VPCs to isolate infrastructure by workload or organizational entity.

A subnet is a range of IP addresses in a VPC. When you launch an instance, you launch it into a subnet in your VPC. Use subnets to isolate the tiers of your application (for example, web, application, and database) within a single VPC. Use private subnets for your instances if they should not be accessed directly from the internet.

To call the Amazon EC2 API from your VPC using private IP addresses, use AWS PrivateLink. For more information, see [Access Amazon EC2 using an interface VPC endpoint \(p. 1692\)](#).

Isolation on physical hosts

Different EC2 instances on the same physical host are isolated from each other as though they are on separate physical hosts. The hypervisor isolates CPU and memory, and the instances are provided virtualized disks instead of access to the raw disk devices.

When you stop or terminate an instance, the memory allocated to it is scrubbed (set to zero) by the hypervisor before it is allocated to a new instance, and every block of storage is reset. This ensures that your data is not unintentionally exposed to another instance.

Network MAC addresses are dynamically assigned to instances by the AWS network infrastructure. IP addresses are either dynamically assigned to instances by the AWS network infrastructure, or assigned by an EC2 administrator through authenticated API requests. The AWS network allows instances to send traffic only from the MAC and IP addresses assigned to them. Otherwise, the traffic is dropped.

By default, an instance cannot receive traffic that is not specifically addressed to it. If you need to run network address translation (NAT), routing, or firewall services on your instance, you can disable source/destination checking for the network interface.

Controlling network traffic

Consider the following options for controlling network traffic to your EC2 instances:

- Restrict access to your instances using [security groups \(p. 1674\)](#). Configure Amazon EC2 instance security groups to permit the minimum required network traffic for the Amazon EC2 instance and to allow access only from defined, expected, and approved locations. For example, if an Amazon EC2 instance is an IIS web server, configure its security groups to permit only inbound HTTP/HTTPS, Windows management traffic, and minimal outbound connections.
- Leverage security groups as the primary mechanism for controlling network access to Amazon EC2 instances. When necessary, use network ACLs sparingly to provide stateless, coarse-grain network control. Security groups are more versatile than network ACLs due to their ability to perform stateful packet filtering and create rules that reference other security groups. However, network ACLs can be effective as a secondary control for denying a specific subset of traffic or providing high-level subnet guard rails. Also, because network ACLs apply to an entire subnet, they can be used as defense-in-depth in case an instance is ever launched unintentionally without a correct security group.
- Centrally manage Windows Firewall settings with Group Policy Objects (GPO) to further enhance network controls. Customers often use the Windows Firewall for further visibility into network traffic and to complement security group filters, creating advanced rules to block specific applications from accessing the network or to filter traffic from a subset IP addresses. For example, the Windows Firewall can limit access to the EC2 metadata service IP address to specific users or applications. Alternatively, a public-facing service might use security groups to restrict traffic to specific ports and the Windows Firewall to maintain a list of explicitly blocked IP addresses.
- When managing Windows instances, limit access to a few well-defined centralized management servers or bastion hosts to reduce the environment's attack surface. Also, use secure administration protocols like RDP encapsulation over SSL/TLS. The Remote Desktop Gateway Quick Start provides best practices for deploying remote desktop gateway, including configuring RDP to use SSL/TLS.
- Use Active Directory or AWS Directory Service to tightly and centrally control and monitor interactive user and group access to Windows instances, and avoid local user permissions. Also avoid using Domain Administrators and instead create more granular, application-specific role-based accounts. Just Enough Administration (JEA) allows changes to Windows instances to be managed without interactive or administrator access. In addition, JEA enables organizations to lock down administrative access to the subset of Windows PowerShell commands required for instance administration. For additional information, see the section on "Managing OS-level Access to Amazon EC2" in the [AWS Security Best Practices](#) whitepaper.
- Systems Administrators should use Windows accounts with limited access to perform daily activities, and only elevate access when necessary to perform specific configuration changes. Additionally, only access Windows instances directly when absolutely necessary. Instead, leverage central configuration management systems such as EC2 Run Command, Systems Center Configuration Manager (SCCM), Windows PowerShell DSC, or Amazon EC2 Systems Manager (SSM) to push changes to Windows servers.
- Configure Amazon VPC subnet route tables with the minimal required network routes. For example, place only Amazon EC2 instances that require direct Internet access into subnets with routes to an Internet Gateway, and place only Amazon EC2 instances that need direct access to internal networks into subnets with routes to a virtual private gateway.
- Consider using additional security groups or ENIs to control and audit Amazon EC2 instance management traffic separately from regular application traffic. This approach allows customers to implement special IAM policies for change control, making it easier to audit changes to security group rules or automated rule-verification scripts. Multiple ENIs also provide additional options for controlling network traffic including the ability to create host-based routing policies or leverage different VPC subnet routing rules based on an ENI's assigned subnet.
- Use AWS Virtual Private Network or AWS Direct Connect to establish private connections from your remote networks to your VPCs. For more information, see [Network-to-Amazon VPC Connectivity Options](#).
- Use [VPC Flow Logs](#) to monitor the traffic that reaches your instances.
- Use [AWS Security Hub](#) to check for unintended network accessibility from your instances.
- Use [AWS Systems Manager Session Manager](#) to access your instances remotely instead of opening inbound RDP ports.

- Use [AWS Systems Manager Run Command](#) to automate common administrative tasks instead of opening inbound RDP ports.
- Many of the Windows OS roles and Microsoft business applications also provide enhanced functionality such as IP Address Range restrictions within IIS, TCP/IP filtering policies in Microsoft SQL Server, and connection filter policies in Microsoft Exchange. Network restriction functionality within the application layer can provide additional layers of defense for critical business application servers.

In addition to restricting network access to each Amazon EC2 instance, Amazon VPC supports implementing additional network security controls like in-line gateways, proxy servers, and various network monitoring options.

Resilience in Amazon EC2

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

If you need to replicate your data or applications over greater geographic distances, use AWS Local Zones. An AWS Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect. Like all AWS Regions, AWS Local Zones are completely isolated from other AWS Zones.

If you need to replicate your data or applications in an AWS Local Zone, AWS recommends that you use one of the following zones as the failover zone:

- Another Local Zone
- An Availability Zone in the Region that is not the parent zone. You can use the [describe-availability-zones](#) command to view the parent zone.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

In addition to the AWS global infrastructure, Amazon EC2 offers the following features to support your data resiliency:

- Copying AMIs across Regions
- Copying EBS snapshots across Regions
- Automating EBS-backed AMIs using Amazon Data Lifecycle Manager
- Automating EBS snapshots using Amazon Data Lifecycle Manager
- Maintaining the health and availability of your fleet using Amazon EC2 Auto Scaling
- Distributing incoming traffic across multiple instances in a single Availability Zone or multiple Availability Zones using Elastic Load Balancing

Data protection in Amazon EC2

The AWS [shared responsibility model](#) applies to data protection in Amazon Elastic Compute Cloud. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the

AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the [AWS Security Blog](#).

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center (successor to AWS Single Sign-On) or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with Amazon EC2 or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Topics

- [Amazon EBS data security \(p. 1582\)](#)
- [Encryption at rest \(p. 1582\)](#)
- [Encryption in transit \(p. 1583\)](#)

Amazon EBS data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in [DoD 5220.22-M](#) (National Industrial Security Program Operating Manual) or [NIST 800-88](#) (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Encryption at rest

EBS volumes

Amazon EBS encryption is an encryption solution for your EBS volumes and snapshots. It uses AWS KMS keys. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

You can also use Microsoft EFS and NTFS permissions for folder- and file-level encryption.

Instance store volumes

The data on NVMe instance store volumes is encrypted using an XTS-AES-256 cipher, implemented on a hardware module on the instance. The keys used to encrypt data that's written to locally-attached NVMe storage devices are per-customer, and per volume. The keys are generated by, and only reside within, the hardware module, which is inaccessible to AWS personnel. The encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

The data on HDD instance store volumes on H1, D3, and D3en instances is encrypted using XTS-AES-256 and one-time keys.

When you stop, hibernate, or terminate an instance, every block of storage in the instance store volume is reset. Therefore, your data cannot be accessed through the instance store of another instance.

Memory

Memory encryption is enabled on the following instances:

- Instances with AWS Graviton processors. AWS Graviton2, AWS Graviton3, and AWS Graviton3E support always-on memory encryption. The encryption keys are securely generated within the host system, do not leave the host system, and are destroyed when the host is rebooted or powered down. For more information, see [AWS Graviton Processors](#).
- Instances with Intel Xeon Scalable processors (Ice Lake), such as M6i instances. These processors support always-on memory encryption using Intel Total Memory Encryption (TME).
- Instances with 3rd generation AMD EPYC processors (Milan), such as M6a instances. These processors support always-on memory encryption using AMD Transparent Single Key Memory Encryption (TSME). They also support AMD Secure Encrypted Virtualization-Secure Nested Paging (SEV-SNP).

Encryption in transit

Encryption at the physical layer

All data flowing across AWS Regions over the AWS global network is automatically encrypted at the physical layer before it leaves AWS secured facilities. All traffic between AZs is encrypted. Additional layers of encryption, including those listed in this section, may provide additional protections.

Encryption provided by Amazon VPC and Transit Gateway cross-Region peering

All cross-Region traffic that uses Amazon VPC and Transit Gateway peering is automatically bulk-encrypted when it exits a Region. An additional layer of encryption is automatically provided at the physical layer for all cross-Region traffic, as previously noted in this section.

Encryption between instances

AWS provides secure and private connectivity between EC2 instances of all types. In addition, some instance types use the offload capabilities of the underlying Nitro System hardware to automatically encrypt in-transit traffic between instances. This encryption uses Authenticated Encryption with Associated Data (AEAD) algorithms, with 256-bit encryption. There is no impact on network performance. To support this additional in-transit traffic encryption between instances, the following requirements must be met:

- The instances use the following instance types:
 - General purpose:** M5dn, M5n, M5zn, M6a, M6i, M6id, M6idn, M6in, M7a, M7i, and M7i-flex
 - Compute optimized:** C5a, C5ad, C5n, C6a, C6i, C6id, C6in, and Hpc7a
 - Memory optimized:** Hpc6id, R5dn, R5n, R6a, R6i, R6idn, R6in, R6id, U-3tb1, U-6tb1, U-9tb1, U-12tb1, U-18tb1, U-24tb1, X2idn, X2iedn, and X2iezn
 - Storage optimized:** D3, D3en, I3en, and I4i
 - Accelerated computing:** G4ad, G4dn, G5, and P3dn

- The instances are in the same Region.
- The instances are in the same VPC or peered VPCs, and the traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

To view the instance types that encrypt in-transit traffic between instances using the AWS CLI

Use the following [describe-instance-types](#) command.

```
aws ec2 describe-instance-types \
--filters Name=network-info.encryption-in-transit-supported,Values=true \
--query "InstanceTypes[*].[InstanceType]" --output text | sort
```

Encryption to and from AWS Outposts

An Outpost creates special network connections called *service links* to its AWS home Region and, optionally, private connectivity to a VPC subnet that you specify. All traffic over those connection is fully encrypted. For more information, see [Connectivity through service links](#) and [Encryption in transit](#) in the [AWS Outposts User Guide](#).

Remote access encryption

RDP provides a secure communications channel for remote access to your Windows instances, whether directly or through EC2 Instance Connect. Remote access to your instances using AWS Systems Manager Session Manager or the Run Command is encrypted using TLS 1.2, and requests to create a connection are signed using [SigV4](#) and authenticated and authorized by [AWS Identity and Access Management](#).

It is your responsibility to use an encryption protocol, such as Transport Layer Security (TLS), to encrypt sensitive data in transit between clients and your Amazon EC2 instances.

Make sure to allow only encrypted connections between EC2 instances and the AWS API endpoints or other sensitive remote network services. You can enforce this through an outbound security group or [Windows Firewall](#) rules.

Windows virtualization-based security features

With the AWS Nitro System, you can enable certain Windows virtualization-based security (VBS) features. VBS is a suite of Windows security mechanisms that use hardware virtualization features to create an isolated compute environment. Currently, only Credential Guard is supported. For more information, see [AWS Nitro System](#).

Topics

- [Credential Guard \(p. 1584\)](#)

Credential Guard

The AWS Nitro System supports Credential Guard for Amazon Elastic Compute Cloud (Amazon EC2) Windows instances. Credential Guard is a Windows virtualization-based security (VBS) feature that enables the creation of isolated environments to protect security assets, such as Windows user credentials and code integrity enforcement, beyond Windows kernel protections. When you run EC2 Windows instances, Credential Guard uses the AWS Nitro System to protect Windows login credentials from being extracted from the OS memory.

Topics

- [Prerequisites \(p. 1585\)](#)
- [Launching a supported instance \(p. 1585\)](#)
- [Disabling memory integrity \(p. 1586\)](#)
- [Turning on Credential Guard \(p. 1586\)](#)
- [Verifying Credential Guard is running \(p. 1588\)](#)
- [Turning off Credential Guard \(p. 1588\)](#)

Prerequisites

Your Windows instance must meet the following prerequisites to utilize Credential Guard:

Amazon Machine Images (AMIs)

The AMI must be preconfigured to enable NitroTPM and UEFI Secure Boot. For more information on supported AMIs, see [Prerequisites for launching a Windows instance with NitroTPM enabled](#).

Memory integrity

Memory integrity, also known as *hypervisor-protected code integrity (HVCI)* or *hypervisor enforced code integrity*, isn't supported. Before you turn on Credential Guard, you must ensure this VBS feature is disabled. For more information, see [Disabling memory integrity \(p. 1586\)](#).

Instance types

The following instance types support Credential Guard across all sizes: C5, C5d, C5n, C6i, C6id, C6in, M5, M5d, M5dn, M5n, M5zn, M6i, M6id, M6idn, M6in, R5, R5b, R5d, R5dn, R5n, R6i, R6id, R6idn, R6in.

Note

Though NitroTPM has some required instance types in common, the instance type must be one of the above to support Credential Guard.

Launching a supported instance

You can use the Amazon EC2 console or AWS Command Line Interface (AWS CLI) to launch an instance which can support Credential Guard. You will need a compatible AMI ID for launching your instance which is unique for each AWS Region.

Tip

You can use the following link to discover and launch instances with compatible Amazon provided AMIs in the Amazon EC2 console:

https://console.aws.amazon.com/ec2/v2/home?#Images:visibility=public-images;v=3;search=:TPM-Windows_Server;ownerAlias=amazon

Amazon EC2 console

To launch an instance using the Amazon EC2 console

Follow the steps to [Launch an instance using the new launch instance wizard](#) while specifying a supported instance type and preconfigured Windows AMI.

AWS CLI

To launch an instance using the AWS CLI

Use the [run-instances](#) command to launch an instance using a supported instance type and preconfigured Windows AMI.

```
aws ec2 run-instances \
    --image-id resolve:ssm:/aws/service/ami-windows-latest/TPM-Windows_Server-2022-
English-Full-Base \
    --instance-type c6i.large \
    --region us-east-1 \
    --key-name keyname
```

PowerShell

To launch an instance using the AWS Tools for PowerShell

Use the [New-EC2Instance](#) command to launch an instance using a supported instance type and preconfigured Windows AMI.

```
New-EC2Instance ` 
    -ImageId resolve:ssm:/aws/service/ami-windows-latest/TPM-Windows_Server-2022-
English-Full-Base ` 
    -InstanceType c6i.large ` 
    -Region us-east-1 ` 
    -KeyName keyname
```

Disabling memory integrity

You can use the Local Group Policy Editor to disable memory integrity in supported scenarios. The following guidance can be applied for each configuration setting:

- **Enabled without lock** – Modify the setting to **Disabled** to disable memory integrity.
- **Enabled with UEFI lock** – Memory integrity has been enabled with UEFI lock. Memory integrity can't be disabled once it has been enabled with UEFI lock. We recommend creating a new instance with memory integrity disabled and terminating the unsupported instance if it's not in use.

To disable memory integrity with the Local Group Policy Editor

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Open the Start menu and search for **cmd** to start a command prompt.
3. Run the following command to open the Local Group Policy Editor: **gpedit.msc**
4. In the Local Group Policy Editor, choose **Computer Configuration**, **Administrative Templates**, **System**, **Device Guard**.
5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.
6. Open the settings drop-down for **Virtualization Based Protection of Code Integrity**, choose **Disabled**, then choose **Apply**.
7. Reboot the instance to apply the changes.

Turning on Credential Guard

After you have launched a Windows instance with a supported instance type and compatible AMI, and confirmed that memory integrity is disabled, you can turn on Credential Guard.

Important

Administrator privileges are required to perform the following steps to turn on Credential Guard.

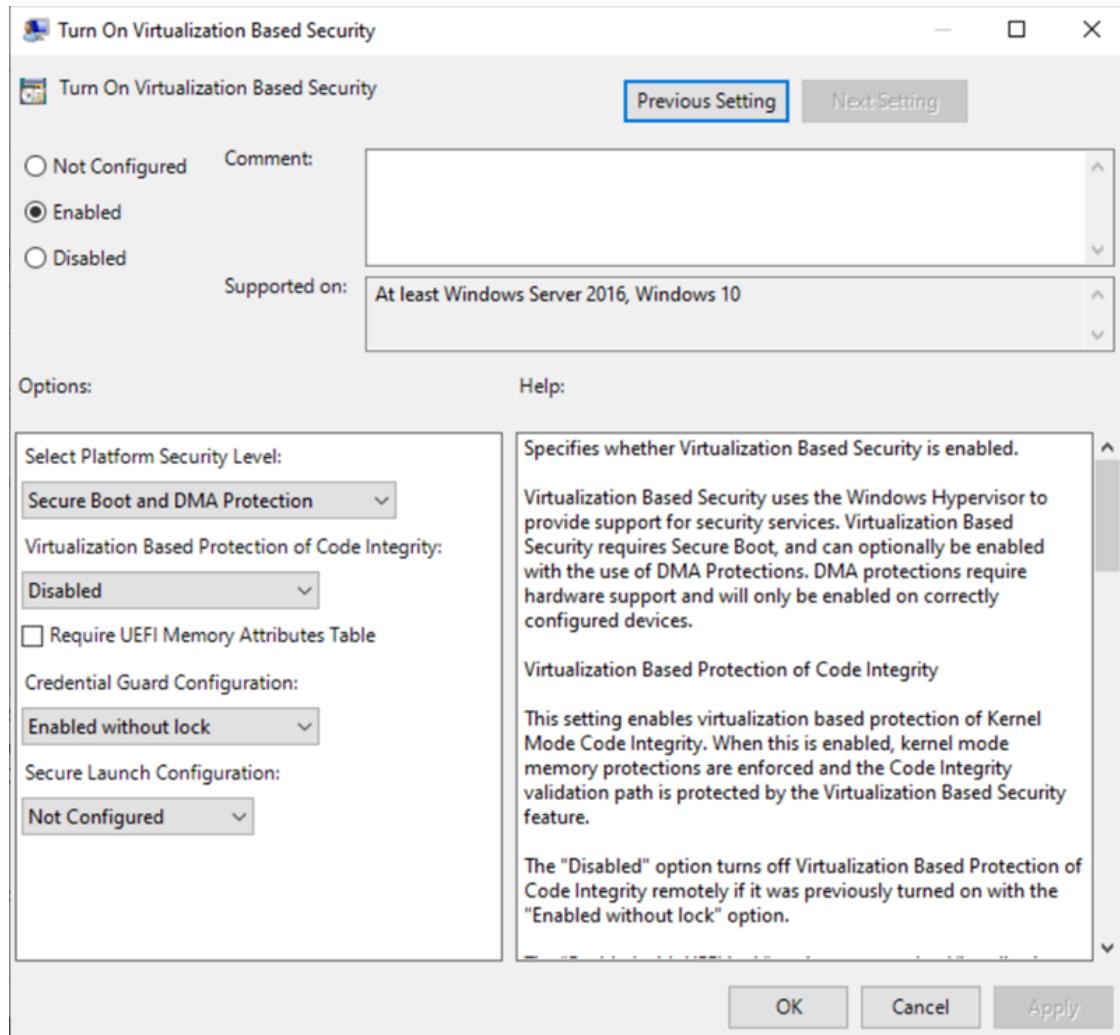

To turn on Credential Guard

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Open the Start menu and search for cmd to start a command prompt.
3. Run the following command to open the Local Group Policy Editor: gpedit.msc
4. In the Local Group Policy Editor, choose **Computer Configuration, Administrative Templates, System, Device Guard**.
5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.
6. Choose **Enabled** within the **Turn On Virtualization Based Security** menu.
7. For **Select Platform Security Level**, choose **Secure Boot and DMA Protection**.
8. For **Credential Guard Configuration**, choose **Enabled without lock**.

Note

The remaining policy settings are not required to enable Credential Guard and can be left as **Not Configured**.

The following image displays the VBS settings configured as described previously:

9. Reboot the instance to apply the settings.

Verifying Credential Guard is running

You can use the Microsoft System Information (Msinfo32.exe) tool to confirm that Credential Guard is running.

Important

You must first reboot the instance to finish applying the policy settings required to enable Credential Guard.

To verify Credential Guard is running

1. Connect to your instance using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Within the RDP session to your instance, open the Start menu and search for **cmd** to start a command prompt.
3. Open System Information by running the following command: `msinfo32.exe`
4. The Microsoft System Information tool lists the details for VBS configuration. Next to Virtualization-based security Services, confirm that **Credential Guard** appears as **Running**.

The following image displays VBS is running as described previously:

Virtualization-based security	Running
Virtualization-based security Required Security Properties	Base Virtualization Support, Secure Boot, DMA Protection
Virtualization-based security Available Security Properties	Base Virtualization Support, Secure Boot, DMA Protection, UEFI Code Readonly, Mode Based Execution Control
Virtualization-based security Services Configured	Credential Guard
Virtualization-based security Services Running	Credential Guard

Turning off Credential Guard

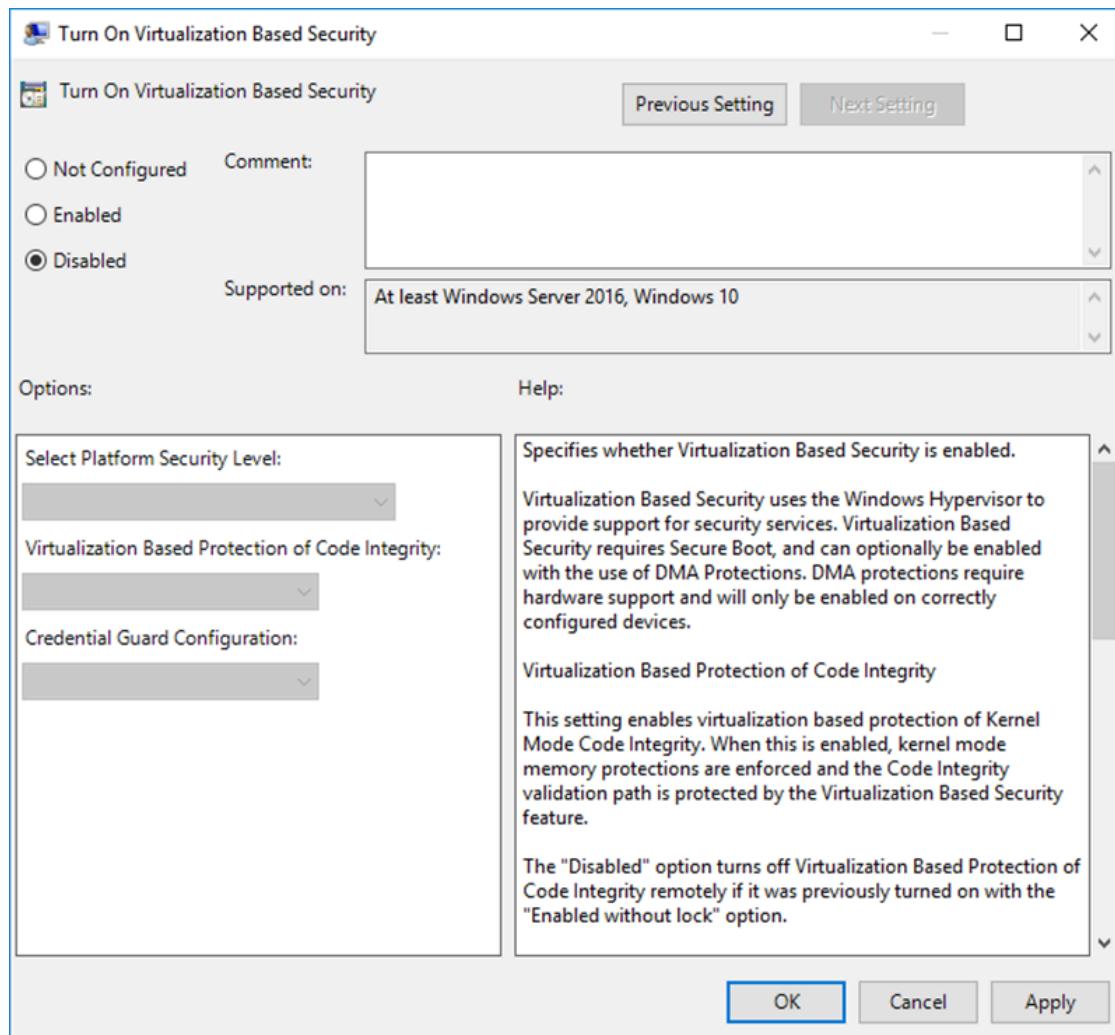

You can turn off Credential Guard if it has been enabled on your EC2 instance.

Important

Administrator privileges are required to perform the following steps to turn off Credential Guard.

To turn off Credential Guard

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see [Connect to your Windows instance using RDP](#).
2. Open the Start menu and search for **cmd** to start a command prompt.
3. Run the following command to open the Local Group Policy Editor: `gpedit.msc`
4. In the Local Group Policy Editor, choose **Computer Configuration**, **Administrative Templates**, **System**, **Device Guard**.
5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.
6. Choose **Disabled** within the **Turn On Virtualization Based Security** menu.
7. The following image displays the VBS settings configured as described previously:

8. Reboot the instance to apply the settings.

Identity and access management for Amazon EC2

Your security credentials identify you to services in AWS and grant you unlimited use of your AWS resources, such as your Amazon EC2 resources. You can use features of Amazon EC2 and AWS Identity and Access Management (IAM) to allow other users, services, and applications to use your Amazon EC2 resources without sharing your security credentials. You can use IAM to control how other users use resources in your AWS account, and you can use security groups to control access to your Amazon EC2 instances. You can choose to allow full use or limited use of your Amazon EC2 resources.

For best practices for securing your AWS resources using IAM, see [Security best practices in IAM](#).

Contents

- [Network access to your instance \(p. 1590\)](#)
- [Amazon EC2 permission attributes \(p. 1590\)](#)
- [IAM and Amazon EC2 \(p. 1590\)](#)
- [IAM policies for Amazon EC2 \(p. 1591\)](#)
- [AWS managed policies for Amazon Elastic Compute Cloud \(p. 1647\)](#)

- [IAM roles for Amazon EC2 \(p. 1649\)](#)
- [Authorize inbound traffic for your Windows instances \(p. 1659\)](#)

Network access to your instance

A security group acts as a firewall that controls the traffic allowed to reach one or more instances. When you launch an instance, you assign it one or more security groups. You add rules to each security group that control traffic for the instance. You can modify the rules for a security group at any time; the new rules are automatically applied to all instances to which the security group is assigned.

For more information, see [Authorize inbound traffic for your Windows instances \(p. 1659\)](#).

Amazon EC2 permission attributes

Your organization might have multiple AWS accounts. Amazon EC2 enables you to specify additional AWS accounts that can use your Amazon Machine Images (AMIs) and Amazon EBS snapshots. These permissions work at the AWS account level only; you can't restrict permissions for specific users within the specified AWS account. All users in the AWS account that you've specified can use the AMI or snapshot.

Each AMI has a `LaunchPermission` attribute that controls which AWS accounts can access the AMI. For more information, see [Make an AMI public \(p. 132\)](#).

Each Amazon EBS snapshot has a `createVolumePermission` attribute that controls which AWS accounts can use the snapshot. For more information, see [Share an Amazon EBS snapshot \(p. 1810\)](#).

IAM and Amazon EC2

IAM enables you to do the following:

- Create users and groups under your AWS account
- Assign unique security credentials to each user under your AWS account
- Control each user's permissions to perform tasks using AWS resources
- Allow the users in another AWS account to share your AWS resources
- Create roles for your AWS account and define the users or services that can assume them
- Use existing identities for your enterprise to grant permissions to perform tasks using AWS resources

By using IAM with Amazon EC2, you can control whether users in your organization can perform a task using specific Amazon EC2 API actions and whether they can use specific AWS resources.

This topic helps you answer the following questions:

- How do I create groups and users in IAM?
- How do I create a policy?
- What IAM policies do I need to carry out tasks in Amazon EC2?
- How do I grant permissions to perform actions in Amazon EC2?
- How do I grant permissions to perform actions on specific resources in Amazon EC2?

Create users, groups, and roles

You can create users and groups for your AWS account and then assign them the permissions they require. As a best practice, users should acquire the permissions by assuming IAM roles. For more information on how to set up users and groups for your AWS account, see [Set up to use Amazon EC2](#).

An [IAM role](#) is an IAM identity that you can create in your account that has specific permissions. An IAM role is similar to an IAM user in that it is an AWS identity with permissions policies that determine what the identity can and cannot do in AWS. However, instead of being uniquely associated with one person, a role is intended to be assumable by anyone who needs it. Also, a role does not have standard long-term credentials such as a password or access keys associated with it. Instead, when you assume a role, it provides you with temporary security credentials for your role session. For more information on how to create IAM roles and grant permissions with them, see [IAM roles for Amazon EC2](#).

Related topics

For more information about IAM, see the following:

- [IAM policies for Amazon EC2 \(p. 1591\)](#)
- [IAM roles for Amazon EC2 \(p. 1649\)](#)
- [AWS Identity and Access Management \(IAM\)](#)
- [IAM User Guide](#)

IAM policies for Amazon EC2

By default, users don't have permission to create or modify Amazon EC2 resources, or perform tasks using the Amazon EC2 API, Amazon EC2 console, or CLI. To allow users to create or modify resources and perform tasks, you must create IAM policies that grant users permission to use the specific resources and API actions they'll need, and then attach those policies to the users, groups, or IAM roles that require those permissions.

When you attach a policy to a user, group of users, or role it allows or denies the users permission to perform the specified tasks on the specified resources. For more general information about IAM policies, see [Policies and permissions in IAM](#) in the *IAM User Guide*. For more information about managing and creating custom IAM policies, see [Managing IAM policies](#).

Getting Started

An IAM policy must grant or deny permissions to use one or more Amazon EC2 actions. It must also specify the resources that can be used with the action, which can be all resources, or in some cases, specific resources. The policy can also include conditions that you apply to the resource.

Amazon EC2 partially supports resource-level permissions. This means that for some EC2 API actions, you cannot specify which resource a user is allowed to work with for that action. Instead, you have to allow users to work with all resources for that action.

Task	Topic
Understand the basic structure of a policy	Policy syntax (p. 1593)
Define actions in your policy	Actions for Amazon EC2 (p. 1593)
Define specific resources in your policy	Amazon Resource Names (ARNs) for Amazon EC2 (p. 1594)
Apply conditions to the use of the resources	Condition keys for Amazon EC2 (p. 1595)
Work with the available resource-level permissions for Amazon EC2	Actions, resources, and condition keys for Amazon EC2
Test your policy	Check that users have the required permissions (p. 1598)

Task	Topic
Generate an IAM policy	Generate policies based on access activity
Example policies for a CLI or SDK	Example policies for working with the AWS CLI or an AWS SDK (p. 1601)
Example policies for the Amazon EC2 console	Example policies for working in the Amazon EC2 console (p. 1639)

Grant permissions to users, groups, and roles

The following are examples of some AWS managed policies that are available to utilize if they meet your needs:

- PowerUserAccess
- ReadOnlyAccess
- AmazonEC2FullAccess
- AmazonEC2ReadOnlyAccess

For more information on the AWS managed policies available to work with Amazon EC2, see [AWS managed policies for Amazon Elastic Compute Cloud](#).

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center (successor to AWS Single Sign-On):

Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide*.
- Users managed in IAM through an identity provider:

Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider \(federation\)](#) in the *IAM User Guide*.
- IAM users:
 - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
 - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user \(console\)](#) in the *IAM User Guide*.

Policy structure

The following topics explain the structure of an IAM policy.

Contents

- [Policy syntax \(p. 1593\)](#)
- [Actions for Amazon EC2 \(p. 1593\)](#)
- [Supported resource-level permissions for Amazon EC2 API actions \(p. 1594\)](#)
- [Amazon Resource Names \(ARNs\) for Amazon EC2 \(p. 1594\)](#)
- [Condition keys for Amazon EC2 \(p. 1595\)](#)
- [Check that users have the required permissions \(p. 1598\)](#)

Policy syntax

An IAM policy is a JSON document that consists of one or more statements. Each statement is structured as follows.

```
{  
    "Statement": [{  
        "Effect": "effect",  
        "Action": "action",  
        "Resource": "arn",  
        "Condition": {  
            "condition": {  
                "key": "value"  
            }  
        }  
    }  
}
```

There are various elements that make up a statement:

- **Effect:** The *effect* can be Allow or Deny. By default, users don't have permission to use resources and API actions, so all requests are denied. An explicit allow overrides the default. An explicit deny overrides any allows.
- **Action:** The *action* is the specific API action for which you are granting or denying permission. To learn about specifying *action*, see [Actions for Amazon EC2 \(p. 1593\)](#).
- **Resource:** The resource that's affected by the action. Some Amazon EC2 API actions allow you to include specific resources in your policy that can be created or modified by the action. You specify a resource using an Amazon Resource Name (ARN) or using the wildcard (*) to indicate that the statement applies to all resources. For more information, see [Supported resource-level permissions for Amazon EC2 API actions \(p. 1594\)](#).
- **Condition:** Conditions are optional. They can be used to control when your policy is in effect. For more information about specifying conditions for Amazon EC2, see [Condition keys for Amazon EC2 \(p. 1595\)](#).

For more information about policy requirements, see the [IAM JSON policy reference](#) in the *IAM User Guide*. For example IAM policy statements for Amazon EC2, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1601\)](#).

Actions for Amazon EC2

In an IAM policy statement, you can specify any API action from any service that supports IAM. For Amazon EC2, use the following prefix with the name of the API action: ec2:. For example: ec2:RunInstances and ec2:CreateImage.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": ["ec2:action1", "ec2:action2"]
```

You can also specify multiple actions using wildcards. For example, you can specify all actions whose name begins with the word "Describe" as follows:

```
"Action": "ec2:Describe*"
```

Note

Currently, the Amazon EC2 Describe* API actions do not support resource-level permissions. For more information about resource-level permissions for Amazon EC2, see [IAM policies for Amazon EC2 \(p. 1591\)](#).

To specify all Amazon EC2 API actions, use the * wildcard as follows:

```
"Action": "ec2:/*"
```

For a list of Amazon EC2 actions, see [Actions defined by Amazon EC2](#) in the *Service Authorization Reference*.

Supported resource-level permissions for Amazon EC2 API actions

Resource-level permissions refers to the ability to specify which resources users are allowed to perform actions on. Amazon EC2 has partial support for resource-level permissions. This means that for certain Amazon EC2 actions, you can control when users are allowed to use those actions based on conditions that have to be fulfilled, or specific resources that users are allowed to use. For example, you can grant users permissions to launch instances, but only of a specific type, and only using a specific AMI.

To specify a resource in an IAM policy statement, use its Amazon Resource Name (ARN). For more information about specifying the ARN value, see [Amazon Resource Names \(ARNs\) for Amazon EC2 \(p. 1594\)](#). If an API action does not support individual ARNs, you must use a wildcard (*) to specify that all resources can be affected by the action.

To see tables that identify which Amazon EC2 API actions support resource-level permissions, and the ARNs and condition keys that you can use in a policy, see [Actions, resources, and condition keys for Amazon EC2](#).

Keep in mind that you can apply tag-based resource-level permissions in the IAM policies you use for Amazon EC2 API actions. This gives you better control over which resources a user can create, modify, or use. For more information, see [Grant permission to tag resources during creation \(p. 1599\)](#).

Amazon Resource Names (ARNs) for Amazon EC2

Each IAM policy statement applies to the resources that you specify using their ARNs.

An ARN has the following general syntax:

```
arn:aws:[service]:[region]:[account-id]:resourceType/resourcePath
```

service

The service (for example, ec2).

region

The Region for the resource (for example, us-east-1).

account-id

The AWS account ID, with no hyphens (for example, 123456789012).

resourceType

The type of resource (for example, instance).

resourcePath

A path that identifies the resource. You can use the * wildcard in your paths.

For example, you can indicate a specific instance (`i-1234567890abcdef0`) in your statement using its ARN as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0"
```

You can specify all instances that belong to a specific account by using the `*` wildcard as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*"
```

You can also specify all Amazon EC2 resources that belong to a specific account by using the `*` wildcard as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:*
```

To specify all resources, or if a specific API action does not support ARNs, use the `*` wildcard in the `Resource` element as follows.

```
"Resource": "*"
```

Many Amazon EC2 API actions involve multiple resources. For example, `AttachVolume` attaches an Amazon EBS volume to an instance, so a user must have permissions to use the volume and the instance. To specify multiple resources in a single statement, separate their ARNs with commas, as follows.

```
"Resource": ["arn1", "arn2"]
```

For a list of ARNs for Amazon EC2 resources, see [Resource types defined by Amazon EC2](#).

Condition keys for Amazon EC2

In a policy statement, you can optionally specify conditions that control when it is in effect. Each condition contains one or more key-value pairs. Condition keys are not case-sensitive. We've defined AWS global condition keys, plus additional service-specific condition keys.

For a list of service-specific condition keys for Amazon EC2, see [Condition keys for Amazon EC2](#). Amazon EC2 also implements the AWS global condition keys. For more information, see [Information available in all requests](#) in the *IAM User Guide*.

To use a condition key in your IAM policy, use the `Condition` statement. For example, the following policy grants users permission to add and remove inbound and outbound rules for any security group. It uses the `ec2:Vpc` condition key to specify that these actions can only be performed on security groups in a specific VPC.

```
{
"Version": "2012-10-17",
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "ec2:AuthorizeSecurityGroupIngress",
            "ec2:AuthorizeSecurityGroupEgress",
            "ec2:RevokeSecurityGroupIngress",
            "ec2:RevokeSecurityGroupEgress"
        ],
        "Resource": "arn:aws:ec2:region:account:security-group/*",
        "Condition": {
            "StringEquals": {
                "ec2:Vpc": "arn:aws:ec2:region:account:vpc-11223344556677889"
            }
        }
    }
]
```

```
}
```

If you specify multiple conditions, or multiple keys in a single condition, we evaluate them using a logical AND operation. If you specify a single condition with multiple values for one key, we evaluate the condition using a logical OR operation. For permissions to be granted, all conditions must be met.

You can also use placeholders when you specify conditions. For more information, see [IAM policy elements: Variables and tags](#) in the *IAM User Guide*.

Important

Many condition keys are specific to a resource, and some API actions use multiple resources. If you write a policy with a condition key, use the Resource element of the statement to specify the resource to which the condition key applies. If not, the policy may prevent users from performing the action at all, because the condition check fails for the resources to which the condition key does not apply. If you do not want to specify a resource, or if you've written the Action element of your policy to include multiple API actions, then you must use the ...IfExists condition type to ensure that the condition key is ignored for resources that do not use it. For more information, see [...IfExists Conditions](#) in the *IAM User Guide*.

All Amazon EC2 actions support the aws:RequestedRegion and ec2:Region condition keys. For more information, see [Example: Restrict access to a specific Region \(p. 1602\)](#).

ec2:SourceInstanceARN condition key

The ec2:SourceInstanceARN condition key can be used for conditions that specify the ARN of the instance from which a request is made. This is an AWS global condition key and is not service-specific. For policy examples, see [Amazon EC2: Attach or detach volumes to an EC2 instance](#) and [Example: Allow a specific instance to view resources in other AWS services \(p. 1634\)](#). The ec2:SourceInstanceARN key cannot be used as a variable to populate the ARN for the Resource element in a statement.

For example policy statements for Amazon EC2, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1601\)](#).

ec2:Attribute condition key

The ec2:Attribute condition key can be used for conditions that filter access by an attribute of a resource. The condition key supports only properties that are of a primitive data type (such as a string or integer), or complex [AttributeValue](#) objects that have only a **Value** property (such as the **Description** or **ImdsSupport** objects of the [ModifyImageAttribute](#) API action).

Important

The condition key can't be used with complex objects that have multiple properties, such as the **LaunchPermission** object of the [ModifyImageAttribute](#) API action.

For example, the following policy uses the ec2:Attribute/Description condition key to filter access by the complex **Description** object of the **ModifyImageAttribute** API action. The condition key allows only requests that modify an image's description to either Production or Development.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:ModifyImageAttribute",
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",
            "Condition": {
                "StringEquals": {
                    "ec2:Attribute/Description": [
```

```

        "Production",
        "Development"
    ]
}
]
}
}
```

The following example policy uses the `ec2:Attribute` condition key to filter access by the primitive **Attribute** property of the **ModifyImageAttribute** API action. The condition key denies all requests that attempt to modify an image's description.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:ModifyImageAttribute",
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",
            "Condition": {
                "StringEquals": {
                    "ec2:Attribute": "Description"
                }
            }
        }
    ]
}
```

[ec2:ResourceId condition keys](#)

When using the following `ec2:ResourceID` condition keys with the specified API actions, the condition key value is used to specify the resulting resource that is created by the API action. `ec2:ResourceID` condition keys can't be used to specify a source resource that is specified in the API request. If you use one of the following `ec2:ResourceID` condition keys with a specified API, then you must always specify the wildcard (*). If you specify a different value, the condition always resolves to * during runtime. For example, to use the `ec2:ImageID` condition key with the **CopyImage** API, then you must specify the condition key as follows:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CopyImage",
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",
            "Condition": {
                "StringEquals": {
                    "ec2:ImageID": "*"
                }
            }
        }
    ]
}
```

Condition key	API action			
<code>ec2:DhcpOptions</code>	<code>CreateDhcpOptions</code>			
<code>ec2:ImageID</code>	<ul style="list-style-type: none"> • <code>CopyImage</code> 			

Condition key	API action			
	<ul style="list-style-type: none"> • CreateImage • ImportImage • RegisterImage 			
ec2:InstanceID	RunInstances			
	<ul style="list-style-type: none"> • ImportInstance 			
ec2:InternetGatewayID	CreateInternetGateway			
ec2:NetworkACLID	CreateNetworkAcl			
ec2:NetworkInterfaceID	CreateNetworkInterface			
ec2:PlacementGroupID	CreatePlacementGroup			
ec2:RouteTableID	CreateRouteTable			
ec2:SecurityGroupID	CreateSecurityGroup			
ec2:SnapshotID	CopySnapshot			
	<ul style="list-style-type: none"> • CreateSnapshot • CreateSnapshots • ImportSnapshots 			
ec2:SubnetID	<ul style="list-style-type: none"> • CreateSubnet 			
ec2:VolumeID	<ul style="list-style-type: none"> • CreateVolume • ImportVolume 			
ec2:VpcID	<ul style="list-style-type: none"> • CreateVpc 			
ec2:VpcPeeringConnectionID	CreateVpcPeeringConnection			

We recommend that you avoid using `ec2:ResourceID` condition keys with these API actions. Instead, if you need to filter access based on specific resource IDs, we recommend that you do so using the `Resource` policy element, as follows:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:CopyImage",
      "Resource": "arn:aws:ec2:us-east-1::image/ami-01234567890abcdef"
    }
  ]
}
```

Check that users have the required permissions

After you've created an IAM policy, we recommend that you check whether it grants users the permissions to use the particular API actions and resources they need before you put the policy into production.

First, create a user for testing purposes, and then attach the IAM policy that you created to the test user. Then, make a request as the test user.

If the Amazon EC2 action that you are testing creates or modifies a resource, you should make the request using the `DryRun` parameter (or run the AWS CLI command with the `--dry-run` option). In this case, the call completes the authorization check, but does not complete the operation. For example, you can check whether the user can terminate a particular instance without actually terminating it. If the test user has the required permissions, the request returns `DryRunOperation`; otherwise, it returns `UnauthorizedOperation`.

If the policy doesn't grant the user the permissions that you expected, or is overly permissive, you can adjust the policy as needed and retest until you get the desired results.

Important

It can take several minutes for policy changes to propagate before they take effect. Therefore, we recommend that you allow five minutes to pass before you test your policy updates.

If an authorization check fails, the request returns an encoded message with diagnostic information. You can decode the message using the `DecodeAuthorizationMessage` action. For more information, see [DecodeAuthorizationMessage](#) in the *AWS Security Token Service API Reference*, and [decode-authorization-message](#) in the *AWS CLI Command Reference*.

Grant permission to tag resources during creation

Some resource-creating Amazon EC2 API actions enable you to specify tags when you create the resource. You can use resource tags to implement attribute-based control (ABAC). For more information, see [Tag your resources \(p. 2086\)](#) and [Control access to EC2 resources using resource tags \(p. 1601\)](#).

To enable users to tag resources on creation, they must have permissions to use the action that creates the resource, such as `ec2:RunInstances` or `ec2>CreateVolume`. If tags are specified in the resource-creating action, Amazon performs additional authorization on the `ec2:CreateTags` action to verify if users have permissions to create tags. Therefore, users must also have explicit permissions to use the `ec2:CreateTags` action.

In the IAM policy definition for the `ec2:CreateTags` action, use the `Condition` element with the `ec2:CreateAction` condition key to give tagging permissions to the action that creates the resource.

The following example demonstrates a policy that allows users to launch instances and apply any tags to instances and volumes during launch. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```
{  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account:/*/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:CreateAction" : "RunInstances"  
                }  
            }  
        }  
    ]  
}
```

Similarly, the following policy allows users to create volumes and apply any tags to the volumes during volume creation. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```
{  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateVolume"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account:*/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:CreateAction" : "CreateVolume"  
                }  
            }  
        }  
    ]  
}
```

The `ec2:CreateTags` action is only evaluated if tags are applied during the resource-creating action. Therefore, a user that has permissions to create a resource (assuming there are no tagging conditions) does not require permissions to use the `ec2:CreateTags` action if no tags are specified in the request. However, if the user attempts to create a resource with tags, the request fails if the user does not have permissions to use the `ec2:CreateTags` action.

The `ec2:CreateTags` action is also evaluated if tags are provided in a launch template. For an example policy, see [Tags in a launch template \(p. 1622\)](#).

Control access to specific tags

You can use additional conditions in the `Condition` element of your IAM policies to control the tag keys and values that can be applied to resources.

The following condition keys can be used with the examples in the preceding section:

- `aws:RequestTag`: To indicate that a particular tag key or tag key and value must be present in a request. Other tags can also be specified in the request.
- Use with the `StringEquals` condition operator to enforce a specific tag key and value combination, for example, to enforce the tag `cost-center=cc123`:

```
"StringEquals": { "aws:RequestTag/cost-center": "cc123" }
```

- Use with the `StringLike` condition operator to enforce a specific tag key in the request; for example, to enforce the tag key `purpose`:

```
"StringLike": { "aws:RequestTag/purpose": "*" }
```

- `aws:TagKeys`: To enforce the tag keys that are used in the request.
- Use with the `ForAllValues` modifier to enforce specific tag keys if they are provided in the request (if tags are specified in the request, only specific tag keys are allowed; no other tags are allowed). For example, the tag keys `environment` or `cost-center` are allowed:

```
"ForAllValues:StringEquals": { "aws:TagKeys": ["environment", "cost-center"] }
```

- Use with the `ForAnyValue` modifier to enforce the presence of at least one of the specified tag keys in the request. For example, at least one of the tag keys `environment` or `webserver` must be present in the request:

```
"ForAnyValue:StringEquals": { "aws:TagKeys": ["environment", "webserver"] }
```

These condition keys can be applied to resource-creating actions that support tagging, as well as the `ec2:CreateTags` and `ec2:DeleteTags` actions. To learn whether an Amazon EC2 API action supports tagging, see [Actions, resources, and condition keys for Amazon EC2](#).

To force users to specify tags when they create a resource, you must use the `aws:RequestTag` condition key or the `aws:TagKeys` condition key with the `ForAnyValue` modifier on the resource-creating action. The `ec2:CreateTags` action is not evaluated if a user does not specify tags for the resource-creating action.

For conditions, the condition key is not case-sensitive and the condition value is case-sensitive. Therefore, to enforce the case-sensitivity of a tag key, use the `aws:TagKeys` condition key, where the tag key is specified as a value in the condition.

For example IAM policies, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1601\)](#). For more information about multi-value conditions, see [Creating a Condition That Tests Multiple Key Values](#) in the *IAM User Guide*.

Control access to EC2 resources using resource tags

When you create an IAM policy that grants users permission to use EC2 resources, you can include tag information in the Condition element of the policy to control access based on tags. This is known as attribute-based access control (ABAC). ABAC provides better control over which resources a user can modify, use, or delete. For more information, see [What is ABAC for AWS?](#)

For example, you can create a policy that allows users to terminate an instance, but denies the action if the instance has the tag `environment=production`. To do this, you use the `aws:ResourceTag` condition key to allow or deny access to the resource based on the tags that are attached to the resource.

```
"StringEquals": { "aws:ResourceTag/environment": "production" }
```

To learn whether an Amazon EC2 API action supports controlling access using the `aws:ResourceTag` condition key, see [Actions, resources, and condition keys for Amazon EC2](#). Note that the `Describe` actions do not support resource-level permissions, so you must specify them in a separate statement without conditions.

For example IAM policies, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1601\)](#).

If you allow or deny users access to resources based on tags, you must consider explicitly denying users the ability to add those tags to or remove them from the same resources. Otherwise, it's possible for a user to circumvent your restrictions and gain access to a resource by modifying its tags.

Example policies for working with the AWS CLI or an AWS SDK

You must grant users the permissions they require for Amazon EC2 using IAM policies. The following examples show policy statements that you could use to control the permissions that users have to Amazon EC2. These policies are designed for requests that are made with the AWS CLI or an AWS SDK.

For more information, see [Creating IAM policies](#) in the IAM User Guide. For example policies for working in the Amazon EC2 console, see [Example policies for working in the Amazon EC2 console \(p. 1639\)](#). For examples of IAM policies specific to Amazon VPC, see [Identity and Access Management for Amazon VPC](#).

In the following examples, replace each *user input placeholder* with your own information.

Examples

- [Example: Read-only access \(p. 1602\)](#)
- [Example: Restrict access to a specific Region \(p. 1602\)](#)
- [Work with instances \(p. 1603\)](#)

- [Work with snapshots \(p. 1607\)](#)
- [Launch instances \(RunInstances\) \(p. 1614\)](#)
- [Work with Spot Instances \(p. 1626\)](#)
- [Example: Work with Reserved Instances \(p. 1630\)](#)
- [Example: Tag resources \(p. 1631\)](#)
- [Example: Work with IAM roles \(p. 1633\)](#)
- [Example: Work with route tables \(p. 1634\)](#)
- [Example: Allow a specific instance to view resources in other AWS services \(p. 1634\)](#)
- [Example: Work with launch templates \(p. 1635\)](#)
- [Work with instance metadata \(p. 1635\)](#)

Example: Read-only access

The following policy grants users permissions to use all Amazon EC2 API actions whose names begin with `Describe`. The `Resource` element uses a wildcard to indicate that users can specify all resources with these API actions. The `*` wildcard is also necessary in cases where the API action does not support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

Users don't have permission to perform any actions on the resources (unless another statement grants them permission to do so) because they're denied permission to use API actions by default.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:Describe*",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Restrict access to a specific Region

The following policy denies users permission to use all Amazon EC2 API actions unless the Region is Europe (Frankfurt). It uses the global condition key `aws:RequestedRegion`, which is supported by all Amazon EC2 API actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {
```

```
{  
    "Effect": "Deny",  
    "Action": "ec2:*",  
    "Resource": "*",  
    "Condition": {  
        "StringNotEquals": {  
            "aws:RequestedRegion": "eu-central-1"  
        }  
    }  
}
```

Alternatively, you can use the condition key `ec2:Region`, which is specific to Amazon EC2 and is supported by all Amazon EC2 API actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": "ec2:*",  
            "Resource": "*",  
            "Condition": {  
                "StringNotEquals": {  
                    "ec2:Region": "eu-central-1"  
                }  
            }  
        }  
    ]  
}
```

Work with instances

Examples

- [Example: Describe, launch, stop, start, and terminate all instances \(p. 1603\)](#)
- [Example: Describe all instances, and stop, start, and terminate only particular instances \(p. 1604\)](#)

Example: Describe, launch, stop, start, and terminate all instances

The following policy grants users permissions to use the API actions specified in the Action element. The Resource element uses a * wildcard to indicate that users can specify all resources with these API actions. The * wildcard is also necessary in cases where the API action does not support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

The users don't have permission to use any other API actions (unless another statement grants them permission to do so) because users are denied permission to use API actions by default.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:DescribeImages",  
                "ec2:DescribeKeyPairs",  
                "ec2:DescribeSecurityGroups",  
                "ec2:RunInstances",  
                "ec2:StopInstances",  
                "ec2:StartInstances",  
                "ec2:TerminateInstances"  
            ]  
        }  
    ]  
}
```

```
        "ec2:DescribeAvailabilityZones",
        "ec2:RunInstances",
        "ec2:TerminateInstances",
        "ec2:StopInstances",
        "ec2:StartInstances"
    ],
    "Resource": "*"
}
]
```

Example: Describe all instances, and stop, start, and terminate only particular instances

The following policy allows users to describe all instances, to start and stop only instances i-1234567890abcdef0 and i-0598c7d356eba48d7, and to terminate only instances in the US East (N. Virginia) Region (us-east-1) with the resource tag "purpose=test".

The first statement uses a * wildcard for the Resource element to indicate that users can specify all resources with the action; in this case, they can list all instances. The * wildcard is also necessary in cases where the API action does not support resource-level permissions (in this case, ec2:DescribeInstances). For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

The second statement uses resource-level permissions for the StopInstances and StartInstances actions. The specific instances are indicated by their ARNs in the Resource element.

The third statement allows users to terminate all instances in the US East (N. Virginia) Region (us-east-1) that belong to the specified AWS account, but only where the instance has the tag "purpose=test". The Condition element qualifies when the policy statement is in effect.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:DescribeInstances",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:StopInstances",
                "ec2:StartInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1:account-id:instance/i-1234567890abcdef0",
                "arn:aws:ec2:us-east-1:account-id:instance/i-0598c7d356eba48d7"
            ]
        },
        {
            "Effect": "Allow",
            "Action": "ec2:TerminateInstances",
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/purpose": "test"
                }
            }
        }
    ]
}
```

Work with volumes

Examples

- [Example: Attach and detach volumes \(p. 1605\)](#)
- [Example: Create a volume \(p. 1605\)](#)
- [Example: Create a volume with tags \(p. 1606\)](#)

Example: Attach and detach volumes

When an API action requires a caller to specify multiple resources, you must create a policy statement that allows users to access all required resources. If you need to use a Condition element with one or more of these resources, you must create multiple statements as shown in this example.

The following policy allows users to attach volumes with the tag "volume_user=iam-user-name" to instances with the tag "department=dev", and to detach those volumes from those instances. If you attach this policy to an IAM group, the aws:username policy variable gives each user in the group permission to attach or detach volumes from the instances with a tag named volume_user that has their username as a value.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:AttachVolume",  
                "ec2:DetachVolume"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/department": "dev"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:AttachVolume",  
                "ec2:DetachVolume"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/volume_user": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

Example: Create a volume

The following policy allows users to use the [CreateVolume](#) API action. The user is allowed to create a volume only if the volume is encrypted and only if the volume size is less than 20 GiB.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {
```

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateVolume"
    ],
    "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
    "Condition": {
        "NumericLessThan": {
            "ec2:VolumeSize" : "20"
        },
        "Bool": {
            "ec2:Encrypted" : "true"
        }
    }
}
```

Example: Create a volume with tags

The following policy includes the `aws:RequestTag` condition key that requires users to tag any volumes they create with the tags `costcenter=115` and `stack=prod`. If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

For resource-creating actions that apply tags, users must also have permissions to use the `CreateTags` action. The second statement uses the `ec2:CreateAction` condition key to allow users to create tags only in the context of `CreateVolume`. Users cannot tag existing volumes or any other resources. For more information, see [Grant permission to tag resources during creation \(p. 1599\)](#).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCreateTaggedVolumes",
            "Effect": "Allow",
            "Action": "ec2:CreateVolume",
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/costcenter": "115",
                    "aws:RequestTag/stack": "prod"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
            "Condition": {
                "StringEquals": {
                    "ec2:CreateAction" : "CreateVolume"
                }
            }
        }
    ]
}
```

The following policy allows users to create a volume without having to specify tags. The `CreateTags` action is only evaluated if tags are specified in the `CreateVolume` request. If users do specify tags, the tag must be `purpose=test`. No other tags are allowed in the request.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateVolume",  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/purpose": "test",  
                    "ec2:CreateAction" : "CreateVolume"  
                },  
                "ForAllValues:StringEquals": {  
                    "aws:TagKeys": "purpose"  
                }  
            }  
        }  
    ]  
}
```

Work with snapshots

The following are example policies for both `CreateSnapshot` (point-in-time snapshot of an EBS volume) and `CreateSnapshots` (multi-volume snapshots).

Examples

- [Example: Create a snapshot \(p. 1607\)](#)
- [Example: Create snapshots \(p. 1608\)](#)
- [Example: Create a snapshot with tags \(p. 1608\)](#)
- [Example: Create multi-volume snapshots with tags \(p. 1609\)](#)
- [Example: Copying snapshots \(p. 1613\)](#)
- [Example: Modify permission settings for snapshots \(p. 1614\)](#)

Example: Create a snapshot

The following policy allows customers to use the `CreateSnapshot` API action. The customer can create snapshots only if the volume is encrypted and only if the volume size is less than 20 GiB.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshot",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshot",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "And": [  
                    {"StringNotEqual": {  
                        "aws:Encryption": "Disabled",  
                        "aws:Encryption": "Enabled"  
                    }},  
                    {"LessThan": {  
                        "aws:VolumeSize": 20,  
                        "aws:VolumeSize": 21  
                    }}  
                ]  
            }  
        }  
    ]  
}
```

```
"NumericLessThan":{  
    "ec2:VolumeSize":"20"  
},  
"Bool":{  
    "ec2:Encrypted":"true"  
}  
}  
]  
}
```

Example: Create snapshots

The following policy allows customers to use the [CreateSnapshots](#) API action. The customer can create snapshots only if all of the volumes on the instance are type GP2.

```
{  
    "Version":"2012-10-17",  
    "Statement": [  
        {  
            "Effect":"Allow",  
            "Action":"ec2:CreateSnapshots",  
            "Resource": [  
                "arn:aws:ec2:us-east-1::snapshot/*",  
                "arn:aws:ec2:*:*:instance/*"  
            ]  
        },  
        {  
            "Effect":"Allow",  
            "Action":"ec2:CreateSnapshots",  
            "Resource":"arn:aws:ec2:us-east-1::*:volume/*",  
            "Condition":{  
                "StringLikeIfExists":{  
                    "ec2:VolumeType":"gp2"  
                }  
            }  
        }  
    ]  
}
```

Example: Create a snapshot with tags

The following policy includes the `aws:RequestTag` condition key that requires the customer to apply the tags `costcenter=115` and `stack=prod` to any new snapshot. If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

For resource-creating actions that apply tags, customers must also have permissions to use the `CreateTags` action. The third statement uses the `ec2:CreateAction` condition key to allow customers to create tags only in the context of `CreateSnapshot`. Customers cannot tag existing volumes or any other resources. For more information, see [Grant permission to tag resources during creation \(p. 1599\)](#).

```
{  
    "Version":"2012-10-17",  
    "Statement": [  
        {  
            "Effect":"Allow",  
            "Action":"ec2:CreateSnapshot",  
            "Resource":"arn:aws:ec2:us-east-1:account-id:volume/*"  
        },  
        {  
            "Effect":"Allow",  
            "Action":"ec2:CreateTags",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:snapshot/*",  
            "Condition": {  
                "StringLikeIfExists": {  
                    "aws:RequestTag/costcenter": "115",  
                    "aws:RequestTag/stack": "prod"  
                }  
            }  
        }  
    ]  
}
```

```
{
    "Sid": "AllowCreateTaggedSnapshots",
    "Effect": "Allow",
    "Action": "ec2:CreateSnapshot",
    "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
    "Condition": {
        "StringEquals": {
            "aws:RequestTag/costcenter": "115",
            "aws:RequestTag/stack": "prod"
        }
    }
},
{
    "Effect": "Allow",
    "Action": "ec2:CreateTags",
    "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
    "Condition": {
        "StringEquals": {
            "ec2:CreateAction": "CreateSnapshot"
        }
    }
}
]
```

Example: Create multi-volume snapshots with tags

The following policy includes the `aws:RequestTag` condition key that requires the customer to apply the tags `costcenter=115` and `stack=prod` when creating a multi-volume snapshot set. If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshots",
            "Resource": [
                "arn:aws:ec2:us-east-1::snapshot/*",
                "arn:aws:ec2:/*:instance/*",
                "arn:aws:ec2:/*:volume/*"
            ]
        },
        {
            "Sid": "AllowCreateTaggedSnapshots",
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshots",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/costcenter": "115",
                    "aws:RequestTag/stack": "prod"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:CreateTags",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "ec2:CreateAction": "CreateSnapshots"
                }
            }
        }
    ]
}
```

```
        }
    ],
}
```

The following policy allows customers to create a snapshot without having to specify tags. The CreateTags action is evaluated only if tags are specified in the CreateSnapshot or CreateSnapshots request. Tags can be omitted in the request. If a tag is specified, the tag must be purpose=test. No other tags are allowed in the request.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshot",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "ec2:CreateTags",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/purpose": "test",
                    "ec2:CreateAction": "CreateSnapshot"
                },
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "purpose"
                }
            }
        }
    ]
}
```

The following policy allows customers to create multi-volume snapshot sets without having to specify tags. The CreateTags action is evaluated only if tags are specified in the CreateSnapshot or CreateSnapshots request. Tags can be omitted in the request. If a tag is specified, the tag must be purpose=test. No other tags are allowed in the request.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshots",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "ec2:CreateTags",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/purpose": "test",
                    "ec2:CreateAction": "CreateSnapshots"
                },
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "purpose"
                }
            }
        }
    ]
}
```

```
    ]  
}
```

The following policy allows snapshots to be created only if the source volume is tagged with `User:username` for the customer, and the snapshot itself is tagged with `Environment:Dev` and `User:username`. The customer can add additional tags to the snapshot.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshot",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/User": "${aws:username}"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshot",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/Environment": "Dev",  
                    "aws:RequestTag/User": "${aws:username}"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*"  
        }  
    ]  
}
```

The following policy for `CreateSnapshots` allows snapshots to be created only if the source volume is tagged with `User:username` for the customer, and the snapshot itself is tagged with `Environment:Dev` and `User:username`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1:*:instance/*",  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/User": "${aws:username}"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*"  
        }  
    ]  
}
```

```

    "Action":"ec2:CreateSnapshots",
    "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
    "Condition":{
        "StringEquals":{
            "aws:RequestTag/Environment":"Dev",
            "aws:RequestTag/User":"${aws:username}"
        }
    },
    {
        "Effect":"Allow",
        "Action":"ec2:CreateTags",
        "Resource":"arn:aws:ec2:us-east-1::snapshot/*"
    }
]
}

```

The following policy allows deletion of a snapshot only if the snapshot is tagged with User:*username* for the customer.

```

{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect":"Allow",
            "Action":"ec2>DeleteSnapshot",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
            "Condition":{
                "StringEquals":{
                    "aws:ResourceTag/User":"${aws:username}"
                }
            }
        }
    ]
}

```

The following policy allows a customer to create a snapshot but denies the action if the snapshot being created has a tag key value=stack.

```

{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect":"Allow",
            "Action":[
                "ec2>CreateSnapshot",
                "ec2>CreateTags"
            ],
            "Resource":"*"
        },
        {
            "Effect":"Deny",
            "Action":"ec2>CreateSnapshot",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
            "Condition":{
                "ForAnyValue:StringEquals":{
                    "aws:TagKeys":"stack"
                }
            }
        }
    ]
}

```

The following policy allows a customer to create snapshots but denies the action if the snapshots being created have a tag key value=stack.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateSnapshots",  
                "ec2:CreateTags"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Deny",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "ForAnyValue:StringEquals": {  
                    "aws:TagKeys": "stack"  
                }  
            }  
        }  
    ]  
}
```

The following policy allows you to combine multiple actions into a single policy. You can only create a snapshot (in the context of CreateSnapshots) when the snapshot is created in Region us-east-1. You can only create snapshots (in the context of CreateSnapshot) when the snapshots are being created in the Region us-east-1 and when the instance type is t2*.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateSnapshots",  
                "ec2:CreateSnapshot",  
                "ec2:CreateTags"  
            ],  
            "Resource": [  
                "arn:aws:ec2:*:*:instance/*",  
                "arn:aws:ec2:*:*:snapshot/*",  
                "arn:aws:ec2:*:*:volume/*"  
            ],  
            "Condition": {  
                "StringEqualsIgnoreCase": {  
                    "ec2:Region": "us-east-1"  
                },  
                "StringLikeIfExists": {  
                    "ec2:InstanceType": ["t2.*"]  
                }  
            }  
        }  
    ]  
}
```

Example: Copying snapshots

Resource-level permissions specified for the *CopySnapshot* action apply to the new snapshot only. They cannot be specified for the source snapshot.

The following example policy allows principals to copy snapshots only if the new snapshot is created with tag key of purpose and a tag value of production (purpose=production).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowCopySnapshotWithTags",  
            "Effect": "Allow",  
            "Action": "ec2:CopySnapshot",  
            "Resource": "arn:aws:ec2:*:account-id:snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/purpose": "production"  
                }  
            }  
        }  
    ]  
}
```

Example: Modify permission settings for snapshots

The following policy allows modification of a snapshot only if the snapshot is tagged with User:**username**, where **username** is the customer's AWS account user name. The request fails if this condition is not met.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:ModifySnapshotAttribute",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/user-name": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

Launch instances (RunInstances)

The [RunInstances](#) API action launches one or more On-Demand Instances or one or more Spot Instances. RunInstances requires an AMI and creates an instance. Users can specify a key pair and security group in the request. Launching into a VPC requires a subnet, and creates a network interface. Launching from an Amazon EBS-backed AMI creates a volume. Therefore, the user must have permissions to use these Amazon EC2 resources. You can create a policy statement that requires users to specify an optional parameter on RunInstances, or restricts users to particular values for a parameter.

For more information about the resource-level permissions that are required to launch an instance, see [Actions, resources, and condition keys for Amazon EC2](#).

By default, users don't have permissions to describe, start, stop, or terminate the resulting instances. One way to grant the users permission to manage the resulting instances is to create a specific tag for each instance, and then create a statement that enables them to manage instances with that tag. For more information, see [Work with instances \(p. 1603\)](#).

Resources

- [Instance types \(p. 1616\)](#)
- [Subnets \(p. 1617\)](#)
- [EBS volumes \(p. 1618\)](#)
- [Tags \(p. 1618\)](#)
- [Tags in a launch template \(p. 1622\)](#)
- [Elastic GPUs \(p. 1623\)](#)
- [Launch templates \(p. 1624\)](#)

AMIs

The following policy allows users to launch instances using only the specified AMIs, ami-9e1670f7 and ami-45cf5c3c. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-9e1670f7",  
                "arn:aws:ec2:region::image/ami-45cf5c3c",  
                "arn:aws:ec2:region:account-id:instance/*",  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:key-pair/*",  
                "arn:aws:ec2:region:account-id:security-group/*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:network-interface/*"  
            ]  
        }  
    ]  
}
```

Alternatively, the following policy allows users to launch instances from all AMIs owned by Amazon, or certain trusted and verified partners. The Condition element of the first statement tests whether ec2:Owner is amazon. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Owner": "amazon"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-*"  
            ]  
        }  
    ]  
}
```

```
        "arn:aws:ec2:region:account-id:instance/*",
        "arn:aws:ec2:region:account-id:subnet/*",
        "arn:aws:ec2:region:account-id:volume/*",
        "arn:aws:ec2:region:account-id:network-interface/*",
        "arn:aws:ec2:region:account-id:key-pair/*",
        "arn:aws:ec2:region:account-id:security-group/*"
    ]
}
]
```

Instance types

The following policy allows users to launch instances using only the t2.micro or t2.small instance type, which you might do to control costs. The users can't launch larger instances because the Condition element of the first statement tests whether ec2:InstanceType is either t2.micro or t2.small.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "StringEquals": {
                    "ec2:InstanceType": ["t2.micro", "t2.small"]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region::image/ami-*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:account-id:key-pair/*",
                "arn:aws:ec2:region:account-id:security-group/*"
            ]
        }
    ]
}
```

Alternatively, you can create a policy that denies users permissions to launch any instances except t2.micro and t2.small instance types.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "StringNotEquals": {
                    "ec2:InstanceType": ["t2.micro", "t2.small"]
                }
            }
        }
    ]
}
```

```

        }
    },
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": [
        "arn:aws:ec2:region::image/ami-*",
        "arn:aws:ec2:region:account-id:network-interface/*",
        "arn:aws:ec2:region:account-id:instance/*",
        "arn:aws:ec2:region:account-id:subnet/*",
        "arn:aws:ec2:region:account-id:volume/*",
        "arn:aws:ec2:region:account-id:key-pair/*",
        "arn:aws:ec2:region:account-id:security-group/*"
    ]
}
]
}

```

Subnets

The following policy allows users to launch instances using only the specified subnet, subnet-**12345678**. The group can't launch instances into any another subnet (unless another statement grants the users permission to do so).

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:subnet/subnet-12345678",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:instance/*",
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region::image/ami-*",
                "arn:aws:ec2:region:account-id:key-pair/*",
                "arn:aws:ec2:region:account-id:security-group/*"
            ]
        }
    ]
}

```

Alternatively, you could create a policy that denies users permissions to launch an instance into any other subnet. The statement does this by denying permission to create a network interface, except where subnet subnet-**12345678** is specified. This denial overrides any other policies that are created to allow launching instances into other subnets.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:network-interface/*"
            ],
            "Condition": {
                "ArnNotEquals": {
                    "ec2:Subnet": "arn:aws:ec2:region:account-id:subnet/subnet-12345678"
                }
            }
        }
    ]
}

```

```

},
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": [
        "arn:aws:ec2:region::image/ami-*",
        "arn:aws:ec2:region:account-id:network-interface/*",
        "arn:aws:ec2:region:account-id:instance/*",
        "arn:aws:ec2:region:account-id:subnet/*",
        "arn:aws:ec2:region:account-id:volume/*",
        "arn:aws:ec2:region:account-id:key-pair/*",
        "arn:aws:ec2:region:account-id:security-group/*"
    ]
}
]
}

```

EBS volumes

The following policy allows users to launch instances only if the EBS volumes for the instance are encrypted. The user must launch an instance from an AMI that was created with encrypted snapshots, to ensure that the root volume is encrypted. Any additional volume that the user attaches to the instance during launch must also be encrypted.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:*::volume/*"
            ],
            "Condition": {
                "Bool": {
                    "ec2:Encrypted": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:*::image/ami-*",
                "arn:aws:ec2:*::network-interface/*",
                "arn:aws:ec2:*::instance/*",
                "arn:aws:ec2:*::subnet/*",
                "arn:aws:ec2:*::key-pair/*",
                "arn:aws:ec2:*::security-group/*"
            ]
        }
    ]
}

```

Tags

Tag instances on creation

The following policy allows users to launch instances and tag the instances during creation. For resource-creating actions that apply tags, users must have permissions to use the `CreateTags` action. The second statement uses the `ec2:CreateAction` condition key to allow users to create tags only in the context of `RunInstances`, and only for instances. Users cannot tag existing resources, and users cannot tag volumes using the `RunInstances` request.

For more information, see [Grant permission to tag resources during creation \(p. 1599\)](#).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:CreateAction" : "RunInstances"  
                }  
            }  
        }  
    ]  
}
```

Tag instances and volumes on creation with specific tags

The following policy includes the aws:RequestTag condition key that requires users to tag any instances and volumes that are created by RunInstances with the tags environment=production and purpose=webserver. If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region::image/*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:network-interface/*",  
                "arn:aws:ec2:region:account-id:security-group/*",  
                "arn:aws:ec2:region:account-id:key-pair/*"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:instance/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production" ,  
                    "aws:RequestTag/purpose": "webserver"  
                }  
            }  
        }  
    ]  
}
```

```

        }
    },
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateTags"
    ],
    "Resource": "arn:aws:ec2:region:account-id:*/**",
    "Condition": {
        "StringEquals": {
            "ec2:CreateAction" : "RunInstances"
        }
    }
}
]
}

```

Tag instances and volumes on creation with at least one specific tag

The following policy uses the ForAnyValue modifier on the aws:TagKeys condition to indicate that at least one tag must be specified in the request, and it must contain the key environment or webserver. The tag must be applied to both instances and volumes. Any tag values can be specified in the request.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:region::image/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:security-group/*",
                "arn:aws:ec2:region:account-id:key-pair/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "ForAnyValue:StringEquals": {
                    "aws:TagKeys": ["environment","webserver"]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "arn:aws:ec2:region:account-id:*/**",
            "Condition": {
                "StringEquals": {
                    "ec2:CreateAction" : "RunInstances"
                }
            }
        }
    ]
}
```

```
        }
    }
}
```

If instances are tagged on creation, they must be tagged with a specific tag

In the following policy, users do not have to specify tags in the request, but if they do, the tag must be purpose=test. No other tags are allowed. Users can apply the tags to any taggable resource in the RunInstances request.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "arn:aws:ec2:region:account-id:*//*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/purpose": "test",
                    "ec2:CreateAction" : "RunInstances"
                },
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "purpose"
                }
            }
        }
    ]
}
```

To disallow anyone called tag on create for RunInstances

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",
                "arn:aws:ec2:us-east-1::volume/*",
                "arn:aws:ec2:us-east-1::instance/*",
                "arn:aws:ec2:us-east-1::spot-instances-request/*"
            ]
        }
    ]
}
```

```
        },
        {
            "Sid": "VisualEditor0",
            "Effect": "Deny",
            "Action": "ec2:CreateTags",
            "Resource": "*"
        }
    ]
}
```

Only allow specific tags for spot-instances-request. Surprise inconsistency number 2 comes into play here. Under normal circumstances, specifying no tags will result in Unauthenticated. In the case of spot-instances-request, this policy will not be evaluated if there are no spot-instances-request tags, so a non-tag Spot on Run request will succeed.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [

            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/environment": "production"
                }
            }
        }
    ]
}
```

Tags in a launch template

In the following example, users can launch instances, but only if they use a specific launch template (lt-09477bcd97b0d310e). The ec2:IsLaunchTemplateResource condition key prevents users from overriding any of the resources specified in the launch template. The second part of the statement allows users to tag instances on creation—this part of the statement is necessary if tags are specified for the instance in the launch template.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",

```

```

    "Action": "ec2:RunInstances",
    "Resource": "*",
    "Condition": {
        "ArnLike": {
            "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/
lt-09477bcd97b0d310e"
        },
        "Bool": {
            "ec2:IsLaunchTemplateResource": "true"
        }
    },
    {
        "Effect": "Allow",
        "Action": [
            "ec2:CreateTags"
        ],
        "Resource": "arn:aws:ec2:region:account-id:instance/*",
        "Condition": {
            "StringEquals": {
                "ec2:CreateAction" : "RunInstances"
            }
        }
    }
}
]
}

```

Elastic GPUs

In the following policy, users can launch an instance and specify an elastic GPU to attach to the instance. Users can launch instances in any Region, but they can only attach an elastic GPU during a launch in the us-east-2 Region.

The ec2:ElasticGpuType condition key ensures that instances use either the eg1.medium or eg1.large elastic GPU type.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:*:account-id:elastic-gpu/*"
            ],
            "Condition": {
                "StringEquals": {
                    "ec2:Region": "us-east-2",
                    "ec2:ElasticGpuType": [
                        "eg1.medium",
                        "eg1.large"
                    ]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2*:::image/ami-*",
                "arn:aws:ec2*:account-id:network-interface/*",
                "arn:aws:ec2*:account-id:instance/*",

```

```
        "arn:aws:ec2:*:account-id:subnet/*",
        "arn:aws:ec2:*:account-id:volume/*",
        "arn:aws:ec2:*:account-id:key-pair/*",
        "arn:aws:ec2:*:account-id:security-group/*"
    ]
}
}
```

Launch templates

In the following example, users can launch instances, but only if they use a specific launch template (`lt-09477bcd97b0d310e`). Users can override any parameters in the launch template by specifying the parameters in the `RunInstances` action.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/
lt-09477bcd97b0d310e"
                }
            }
        }
    ]
}
```

In this example, users can launch instances only if they use a launch template. The policy uses the `ec2:IsLaunchTemplateResource` condition key to prevent users from overriding any pre-existing ARNs in the launch template.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        }
    ]
}
```

The following example policy allows user to launch instances, but only if they use a launch template. Users cannot override the subnet and network interface parameters in the request; these parameters can only be specified in the launch template. The first part of the statement uses the [NotResource](#) element to allow all other resources except subnets and network interfaces. The second part of the statement allows the subnet and network interface resources, but only if they are sourced from the launch template.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "NotResource": ["arn:aws:ec2:region:account-id:subnet/*",
                           "arn:aws:ec2:region:account-id:network-interface/*"],
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": ["arn:aws:ec2:region:account-id:subnet/*",
                         "arn:aws:ec2:region:account-id:network-interface/*"],
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        }
    ]
}
```

The following example allows users to launch instances only if they use a launch template, and only if the launch template has the tag Purpose=Webservers. Users cannot override any of the launch template parameters in the RunInstances action.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "NotResource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Purpose": "Webservers"
                }
            }
        }
    ]
}
```

Work with Spot Instances

You can use the RunInstances action to create Spot Instance requests, and tag the Spot Instance requests on create. The resource to specify for RunInstances is spot-instances-request.

The spot-instances-request resource is evaluated in the IAM policy as follows:

- If you don't tag a Spot Instance request on create, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement.
- If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

Therefore, for the spot-instances-request resource, the following rules apply to the IAM policy:

- If you use RunInstances to create a Spot Instance request and you don't intend to tag the Spot Instance request on create, you don't need to explicitly allow the spot-instances-request resource; the call will succeed.
- If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must include the spot-instances-request resource in the RunInstances allow statement, otherwise the call will fail.
- If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must specify the spot-instances-request resource or * wildcard in the CreateTags allow statement, otherwise the call will fail.

You can request Spot Instances using RunInstances or RequestSpotInstances. The following example IAM policies apply only when requesting Spot Instances using RunInstances.

Example: Request Spot Instances using RunInstances

The following policy allows users to request Spot Instances by using the RunInstances action. The spot-instances-request resource, which is created by RunInstances, requests Spot Instances.

Note

To use RunInstances to create Spot Instance requests, you can omit spot-instances-request from the Resource list if you do not intend to tag the Spot Instance requests on create. This is because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1::subnet/*",  
                "arn:aws:ec2:us-east-1::network-interface/*",  
                "arn:aws:ec2:us-east-1::security-group/*",  
                "arn:aws:ec2:us-east-1::key-pair/*",  
                "arn:aws:ec2:us-east-1::volume/*",  
                "arn:aws:ec2:us-east-1::instance/*",  
                "arn:aws:ec2:us-east-1::spot-instances-request/*"  
            ]  
        }  
    ]  
}
```

```
    ]  
}
```

Warning

NOT SUPPORTED – Example: Deny users permission to request Spot Instances using RunInstances

The following policy is not supported for the spot-instances-request resource. The following policy is meant to give users the permission to launch On-Demand Instances, but deny users the permission to request Spot Instances. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement is meant to deny the RunInstances action for the spot-instances-request resource. However, this condition is not supported because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1::subnet/*",  
                "arn:aws:ec2:us-east-1::network-interface/*",  
                "arn:aws:ec2:us-east-1::security-group/*",  
                "arn:aws:ec2:us-east-1::key-pair/*",  
                "arn:aws:ec2:us-east-1::volume/*",  
                "arn:aws:ec2:us-east-1::instance/*"  
            ]  
        },  
        {  
            "Sid": "DenySpotInstancesRequests - NOT SUPPORTED - DO NOT USE!",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*"  
        }  
    ]  
}
```

Example: Tag Spot Instance requests on create

The following policy allows users to tag all resources that are created during instance launch. The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to allow all resources to be tagged when they are created at instance launch.

Note

If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement. Therefore, you must explicitly allow the spot-instances-request resource for the RunInstances action, otherwise the call will fail.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "  
                arn:aws:ec2:us-east-1::spot-instances-request/*"  
        }  
    ]  
}
```

```

        "Effect": "Allow",
        "Action": [
            "ec2:RunInstances"
        ],
        "Resource": [
            "arn:aws:ec2:us-east-1::image/*",
            "arn:aws:ec2:us-east-1::subnet/*",
            "arn:aws:ec2:us-east-1::network-interface/*",
            "arn:aws:ec2:us-east-1::security-group/*",
            "arn:aws:ec2:us-east-1::key-pair/*",
            "arn:aws:ec2:us-east-1::volume/*",
            "arn:aws:ec2:us-east-1::instance/*",
            "arn:aws:ec2:us-east-1::spot-instances-request/*"
        ]
    },
    {
        "Sid": "TagResources",
        "Effect": "Allow",
        "Action": "ec2:CreateTags",
        "Resource": "*"
    }
]
}

```

Example: Deny tag on create for Spot Instance requests

The following policy denies users the permission to tag the resources that are created during instance launch.

The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to deny all resources being tagged when they are created at instance launch. If spot-instances-request or any other resource is tagged on create, the RunInstances call will fail.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",
                "arn:aws:ec2:us-east-1::volume/*",
                "arn:aws:ec2:us-east-1::instance/*",
                "arn:aws:ec2:us-east-1::spot-instances-request/*"
            ]
        },
        {
            "Sid": "DenyTagResources",
            "Effect": "Deny",
            "Action": "ec2:CreateTags",
            "Resource": "*"
        }
    ]
}

```

Warning

NOT SUPPORTED – Example: Allow creating a Spot Instance request only if it is assigned a specific tag

The following policy is not supported for the spot-instances-request resource.

The following policy is meant to grant RunInstances the permission to create a Spot Instance request only if the request is tagged with a specific tag.

The first statement allows RunInstances to create the listed resources.

The second statement is meant to grant users the permission to create a Spot Instance request only if the request has the tag environment=production. If this condition is applied to other resources created by RunInstances, specifying no tags results in an Unauthenticated error. However, if no tags are specified for the Spot Instance request, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement, which results in non-tagged Spot Instance requests being created by RunInstances.

Note that specifying another tag other than environment=production results in an Unauthenticated error, because if a user tags a Spot Instance request, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1::subnet/*",  
                "arn:aws:ec2:us-east-1::network-interface/*",  
                "arn:aws:ec2:us-east-1::security-group/*",  
                "arn:aws:ec2:us-east-1::key-pair/*",  
                "arn:aws:ec2:us-east-1::volume/*",  
                "arn:aws:ec2:us-east-1::instance/*"  
            ]  
        },  
        {  
            "Sid": "RequestSpotInstancesOnlyIfTagIs_environment=production - NOT  
SUPPORTED - DO NOT USE!",  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                }  
            }  
        },  
        {  
            "Sid": "TagResources",  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Deny creating a Spot Instance request if it is assigned a specific tag

The following policy denies RunInstances the permission to create a Spot Instance request if the request is tagged with environment=production.

The first statement allows RunInstances to create the listed resources.

The second statement denies users the permission to create a Spot Instance request if the request has the tag environment=production. Specifying environment=production as a tag results in an Unauthenticated error. Specifying other tags or specifying no tags will result in the creation of a Spot Instance request.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1:*:subnet/*",  
                "arn:aws:ec2:us-east-1:*:network-interface/*",  
                "arn:aws:ec2:us-east-1:*:security-group/*",  
                "arn:aws:ec2:us-east-1:*:key-pair/*",  
                "arn:aws:ec2:us-east-1:*:volume/*",  
                "arn:aws:ec2:us-east-1:*:instance/*",  
                "arn:aws:ec2:us-east-1:*:spot-instances-request/*"  
            ]  
        },  
        {  
            "Sid": "DenySpotInstancesRequests",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1:*:spot-instances-request/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                }  
            }  
        },  
        {  
            "Sid": "TagResources",  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Work with Reserved Instances

The following policy gives users permission to view, modify, and purchase Reserved Instances in your account.

It is not possible to set resource-level permissions for individual Reserved Instances. This policy means that users have access to all the Reserved Instances in the account.

The Resource element uses a * wildcard to indicate that users can specify all resources with the action; in this case, they can list and modify all Reserved Instances in the account. They can also purchase Reserved Instances using the account credentials. The * wildcard is also necessary in cases where the API action does not support resource-level permissions.

```
{  
    "Version": "2012-10-17",
```

```
"Statement": [
  {
    "Effect": "Allow",
    "Action": [
      "ec2:DescribeReservedInstances",
      "ec2:ModifyReservedInstances",
      "ec2:PurchaseReservedInstancesOffering",
      "ec2:DescribeAvailabilityZones",
      "ec2:DescribeReservedInstancesOfferings"
    ],
    "Resource": "*"
  }
]
```

To allow users to view and modify the Reserved Instances in your account, but not purchase new Reserved Instances.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeReservedInstances",
        "ec2:ModifyReservedInstances",
        "ec2:DescribeAvailabilityZones"
      ],
      "Resource": "*"
    }
  ]
}
```

Example: Tag resources

The following policy allows users to use the `CreateTags` action to apply tags to an instance only if the tag contains the key `environment` and the value `production`. No other tags are allowed and the user cannot tag any other resource types.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:CreateTags"
      ],
      "Resource": "arn:aws:ec2:region:account-id:instance/*",
      "Condition": {
        "StringEquals": {
          "aws:RequestTag/environment": "production"
        }
      }
    }
  ]
}
```

The following policy allows users to tag any taggable resource that already has a tag with a key of `owner` and a value of the `username`. In addition, users must specify a tag with a key of `anycompany:environment`-type and a value of either `test` or `prod` in the request. Users can specify additional tags in the request.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:*/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/anycompany:environment-type": ["test", "prod"],  
                    "aws:ResourceTag/owner": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

You can create an IAM policy that allows users to delete specific tags for a resource. For example, the following policy allows users to delete tags for a volume if the tag keys specified in the request are environment or cost-center. Any value can be specified for the tag but the tag key must match either of the specified keys.

Note

If you delete a resource, all tags associated with the resource are also deleted. Users do not need permissions to use the ec2:DeleteTags action to delete a resource that has tags; they only need permissions to perform the deleting action.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DeleteTags",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "ForAllValues:StringEquals": {  
                    "aws:TagKeys": ["environment", "cost-center"]  
                }  
            }  
        }  
    ]  
}
```

This policy allows users to delete only the environment=prod tag on any resource, and only if the resource is already tagged with a key of owner and a value of the username. Users can't delete any other tags for a resource.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DeleteTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:*/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "prod",  
                    "aws:ResourceTag/owner": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

```
        },
        "ForAllValues:StringEquals": {
            "aws:TagKeys": ["environment"]
        }
    }
]
```

Example: Work with IAM roles

The following policy allows users to attach, replace, and detach an IAM role to instances that have the tag department=test. Replacing or detaching an IAM role requires an association ID, therefore the policy also grants users permission to use the ec2:DescribeIamInstanceProfileAssociations action.

Users must have permission to use the iam:PassRole action in order to pass the role to the instance.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AssociateIamInstanceProfile",
                "ec2:ReplaceIamInstanceProfileAssociation",
                "ec2:DisassociateIamInstanceProfile"
            ],
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/department": "test"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:DescribeIamInstanceProfileAssociations",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::account-id:role/DevTeam"
        }
    ]
}
```

The following policy allows users to attach or replace an IAM role for any instance. Users can only attach or replace IAM roles with names that begin with TestRole-. For the iam:PassRole action, ensure that you specify the name of the IAM role and not the instance profile (if the names are different). For more information, see [Instance profiles \(p. 1650\)](#).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AssociateIamInstanceProfile",
                "ec2:ReplaceIamInstanceProfileAssociation"
            ],
            "Resource": "arn:aws:iam::account-id:role/TestRole-*"
        }
    ]
}
```

```

        "Resource": "*"
    },
{
    "Effect": "Allow",
    "Action": "ec2:DescribeIamInstanceProfileAssociations",
    "Resource": "*"
},
{
    "Effect": "Allow",
    "Action": "iam:PassRole",
    "Resource": "arn:aws:iam::account-id:role/TestRole-*"
}
]
}

```

Example: Work with route tables

The following policy allows users to add, remove, and replace routes for route tables that are associated with VPC `vpc-ec43eb89` only. To specify a VPC for the `ec2:Vpc` condition key, you must specify the full ARN of the VPC.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DeleteRoute",
                "ec2>CreateRoute",
                "ec2:ReplaceRoute"
            ],
            "Resource": [
                "arn:aws:ec2:region:account-id:route-table/*"
            ],
            "Condition": {
                "StringEquals": {
                    "ec2:Vpc": "arn:aws:ec2:region:account-id:vpc/vpc-ec43eb89"
                }
            }
        }
    ]
}

```

Example: Allow a specific instance to view resources in other AWS services

The following is an example of a policy that you might attach to an IAM role. The policy allows an instance to view resources in various AWS services. It uses the `ec2:SourceInstanceARN` condition key to specify that the instance from which the request is made must be instance `i-093452212644b0dd6`. If the same IAM role is associated with another instance, the other instance cannot perform any of these actions.

The `ec2:SourceInstanceARN` key is an AWS global condition key, therefore it can be used for other service actions, not just Amazon EC2.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeVolumes",
                "s3>ListAllMyBuckets",

```

```
        "dynamodb>ListTables",
        "rds:DescribeDBInstances"
    ],
    "Resource": [
        "*"
    ],
    "Condition": {
        "ArnEquals": {
            "ec2:SourceInstanceARN": "arn:aws:ec2:region:account-id:instance/i-093452212644b0dd6"
        }
    }
]
```

Example: Work with launch templates

The following policy allows users to create a launch template version and modify a launch template, but only for a specific launch template (**lt-09477bcd97b0d3abc**). Users cannot work with other launch templates.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "ec2>CreateLaunchTemplateVersion",
                "ec2:ModifyLaunchTemplate"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/lt-09477bcd97b0d3abc"
        }
    ]
}
```

The following policy allows users to delete any launch template and launch template version, provided that the launch template has the tag Purpose=Testing.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "ec2>DeleteLaunchTemplate",
                "ec2>DeleteLaunchTemplateVersions"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Purpose": "Testing"
                }
            }
        }
    ]
}
```

Work with instance metadata

The following policies ensure that users can only retrieve [instance metadata \(p. 862\)](#) using Instance Metadata Service Version 2 (IMDSv2). You can combine the following four policies into one policy with

four statements. When combined as one policy, you can use the policy as a service control policy (SCP). It can work equally well as a *deny* policy that you apply to an existing IAM policy (taking away and limiting existing permission), or as an SCP that is applied globally across an account, an organizational unit (OU), or an entire organization.

Note

The following RunInstances metadata options policies must be used in conjunction with a policy that gives the principal permissions to launch an instance with RunInstances. If the principal does not also have RunInstances permissions, it will not be able to launch an instance. For more information, see the policies in [Work with instances \(p. 1603\)](#) and [Launch instances \(RunInstances\) \(p. 1614\)](#).

Important

If you use Auto Scaling groups and you need to require the use of IMDSv2 on all new instances, your Auto Scaling groups must use *launch templates*.

When an Auto Scaling group uses a launch template, the ec2:RunInstances permissions of the IAM principal are checked when a new Auto Scaling group is created. They are also checked when an existing Auto Scaling group is updated to use a new launch template or a new version of a launch template.

Restrictions on the use of IMDSv1 on IAM principals for RunInstances are only checked when an Auto Scaling group that is using a launch template, is created or updated. For an Auto Scaling group that is configured to use the Latest or Default launch template, the permissions are not checked when a new version of the launch template is created. For permissions to be checked, you must configure the Auto Scaling group to use a *specific version* of the launch template.

To enforce the use of IMDSv2 on instances launched by Auto Scaling groups, the following additional steps are required:

1. Disable the use of launch configurations for all accounts in your organization by using either service control policies (SCPs) or IAM permissions boundaries for new principals that are created. For existing IAM principals with Auto Scaling group permissions, update their associated policies with this condition key. To disable the use of launch configurations, create or modify the relevant SCP, permissions boundary, or IAM policy with the "autoscaling:LaunchConfigurationName" condition key with the value specified as null.
2. For new launch templates, configure the instance metadata options in the launch template. For existing launch templates, create a new version of the launch template and configure the instance metadata options in the new version.
3. In the policy that gives any principal the permission to use a launch template, restrict association of \$latest and \$default by specifying "autoscaling:LaunchTemplateVersionSpecified": "true". By restricting the use to a specific version of a launch template, you can ensure that new instances will be launched using the version in which the instance metadata options are configured. For more information, see [LaunchTemplateSpecification](#) in the *Amazon EC2 Auto Scaling API Reference*, specifically the Version parameter.
4. For an Auto Scaling group that uses a launch configuration, replace the launch configuration with a launch template. For more information, see [Replacing a Launch Configuration with a Launch Template](#) in the *Amazon EC2 Auto Scaling User Guide*.
5. For an Auto Scaling group that uses a launch template, make sure that it uses a new launch template with the instance metadata options configured, or uses a new version of the current launch template with the instance metadata options configured. For more information, see [update-auto-scaling-group](#) in the *AWS CLI Command Reference*.

Examples

- [Require the use of IMDSv2 \(p. 1637\)](#)

- [Deny opt-out of IMDSv2 \(p. 1637\)](#)
- [Specify maximum hop limit \(p. 1637\)](#)
- [Limit who can modify the instance metadata options \(p. 1638\)](#)
- [Require role credentials to be retrieved from IMDSv2 \(p. 1638\)](#)

Require the use of IMDSv2

The following policy specifies that you can't call the RunInstances API unless the instance is also opted in to require the use of IMDSv2 (indicated by "ec2:MetadataHttpTokens": "required"). If you do not specify that the instance requires IMDSv2, you get an UnauthorizedOperation error when you call the RunInstances API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "RequireImdsV2",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:*:*:instance/*",  
            "Condition": {  
                "StringNotEquals": {  
                    "ec2:MetadataHttpTokens": "required"  
                }  
            }  
        }  
    ]  
}
```

Deny opt-out of IMDSv2

The following policy specifies that you cannot call the ModifyInstanceMetadataOptions API and allow the option of IMDSv1 or IMDSv2. If you call the ModifyInstanceMetadataOptions API, the HttpTokens attribute must be set to required.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Sid": "DenyIMDSv1HttpTokensModification",  
        "Effect": "Deny",  
        "Action": "ec2:ModifyInstanceMetadataOptions",  
        "Resource": "arn:aws:ec2:*:*:instance/*",  
        "Condition": {  
            "StringNotEquals": {  
                "ec2:Attribute/HttpTokens": "required"  
            },  
            "Null": {  
                "ec2:Attribute/HttpTokens": false  
            }  
        }  
    }]  
}
```

Specify maximum hop limit

The following policy specifies that you can't call the RunInstances API unless you also specify a hop limit, and the hop limit can't be more than 3. If you fail to do that, you get an UnauthorizedOperation error when you call the RunInstances API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "MaxImdsHopLimit",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:*:instance/*",  
            "Condition": {  
                "NumericGreaterThan": {  
                    "ec2:MetadataHttpPutResponseHopLimit": "3"  
                }  
            }  
        }  
    ]  
}
```

Limit who can modify the instance metadata options

The following policy permits only users with the role ec2-imds-admins to make changes to the instance metadata options. If any principal other than the ec2-imds-admins role tries to call the ModifyInstanceMetadataOptions API, it will get an UnauthorizedOperation error. This statement could be used to control the use of the ModifyInstanceMetadataOptions API; there are currently no fine-grained access controls (conditions) for the ModifyInstanceMetadataOptions API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowOnlyImdsAdminsToModifySettings",  
            "Effect": "Deny",  
            "Action": "ec2:ModifyInstanceMetadataOptions",  
            "Resource": "*",  
            "Condition": {  
                "StringNotLike": {  
                    "aws:PrincipalARN": "arn:aws:iam::*:role/ec2-imds-admins"  
                }  
            }  
        }  
    ]  
}
```

Require role credentials to be retrieved from IMDSv2

The following policy specifies that if this policy is applied to a role, and the role is assumed by the EC2 service and the resulting credentials are used to sign a request, then the request must be signed by EC2 role credentials retrieved from IMDSv2. Otherwise, all of its API calls will get an UnauthorizedOperation error. This statement/policy can be applied generally because, if the request is not signed by EC2 role credentials, it has no effect.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "RequireAllEc2RolesToUseV2",  
            "Effect": "Deny",  
            "Action": "*",  
            "Resource": "*",  
            "Condition": {  
                "NumericLessThan": {  
                    "ec2:RoleDelivery": "2.0"  
                }  
            }  
        }  
    ]  
}
```

```
        }
    }
}
```

Example policies for working in the Amazon EC2 console

You must grant users the permissions they require for Amazon EC2 using IAM policies. You can use IAM policies to grant users permissions to view and work with specific resources in the Amazon EC2 console. You can use the example policies in the previous section; however, they are designed for requests that are made with the AWS CLI or an AWS SDK. For more information, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1601\)](#) and [Creating IAM policies](#) in the IAM User Guide.

The console uses additional API actions for its features, so these policies may not work as expected. For example, a user that has permission to use only the `DescribeVolumes` API action will encounter errors when trying to view volumes in the console. This section demonstrates policies that enable users to work with specific parts of the console. For additional information about creating policies for the Amazon EC2 console, see the following AWS Security Blog post: [Granting Users Permission to Work in the Amazon EC2 Console](#).

Tip

To help you work out which API actions are required to perform tasks in the console, you can use a service such as AWS CloudTrail. For more information, see the [AWS CloudTrail User Guide](#). If your policy does not grant permission to create or modify a specific resource, the console displays an encoded message with diagnostic information. You can decode the message using the `DecodeAuthorizationMessage` API action for AWS STS, or the `decode-authorization-message` command in the AWS CLI.

Examples

- [Example: Read-only access \(p. 1639\)](#)
- [Example: Use the EC2 launch instance wizard \(p. 1640\)](#)
- [Example: Work with volumes \(p. 1643\)](#)
- [Example: Work with security groups \(p. 1644\)](#)
- [Example: Work with Elastic IP addresses \(p. 1646\)](#)
- [Example: Work with Reserved Instances \(p. 1647\)](#)

Example: Read-only access

To allow users to view all resources in the Amazon EC2 console, you can use the same policy as the following example: [Example: Read-only access \(p. 1602\)](#). Users cannot perform any actions on those resources or create new resources, unless another statement grants them permission to do so.

View instances, AMIs, and snapshots

Alternatively, you can provide read-only access to a subset of resources. To do this, replace the * wildcard in the `ec2:Describe` API action with specific `ec2:Describe` actions for each resource. The following policy allows users to view all instances, AMIs, and snapshots in the Amazon EC2 console. The `ec2:DescribeTags` action allows users to view public AMIs. The console requires the tagging information to display public AMIs; however, you can remove this action to allow users to view only private AMIs.

```
{
    "Version": "2012-10-17",
    "Statement": [
```

```
"Effect": "Allow",
"Action": [
    "ec2:DescribeInstances",
    "ec2:DescribeImages",
    "ec2:DescribeTags",
    "ec2:DescribeSnapshots"
],
"Resource": "*"
}
]
```

Note

The Amazon EC2 ec2:Describe* API actions do not support resource-level permissions, so you cannot control which individual resources users can view in the console. Therefore, the * wildcard is necessary in the Resource element of the above statement. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

View instances and CloudWatch metrics

The following policy allows users to view instances in the Amazon EC2 console, as well as CloudWatch alarms and metrics in the **Monitoring** tab of the **Instances** page. The Amazon EC2 console uses the CloudWatch API to display the alarms and metrics, so you must grant users permission to use the cloudwatch:DescribeAlarms and cloudwatch:GetMetricStatistics actions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstances",
                "cloudwatch:DescribeAlarms",
                "cloudwatch:GetMetricStatistics"
            ],
            "Resource": "*"
        }
    ]
}
```

Example: Use the EC2 launch instance wizard

The Amazon EC2 launch instance wizard is a screen with options to configure and launch an instance. Your policy must include permission to use the API actions that allow users to work with the wizard's options. If your policy does not include permission to use those actions, some items in the wizard cannot load properly, and users cannot complete a launch.

Basic launch instance wizard access

To complete a launch successfully, users must be given permission to use the ec2:RunInstances API action, and at least the following API actions:

- ec2:DescribeImages: To view and select an AMI.
- ec2:DescribeInstanceTypes: To view and select an instance type.
- ec2:DescribeVpcs: To view the available network options.
- ec2:DescribeSubnets: To view all available subnets for the chosen VPC.
- ec2:DescribeSecurityGroups or ec2>CreateSecurityGroup: To view and select an existing security group, or to create a new one.

- `ec2:DescribeKeyPairs` or `ec2:CreateKeyPair`: To select an existing key pair, or to create a new one.
- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:DescribeImages",  
                "ec2:DescribeInstanceTypes",  
                "ec2:DescribeKeyPairs",  
                "ec2:DescribeVpcs",  
                "ec2:DescribeSubnets",  
                "ec2:DescribeSecurityGroups",  
                "ec2:CreateSecurityGroup",  
                "ec2:AuthorizeSecurityGroupIngress",  
                "ec2:CreateKeyPair"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "*"  
        }  
    ]  
}
```

You can add API actions to your policy to provide more options for users, for example:

- `ec2:DescribeAvailabilityZones`: To view and select a specific Availability Zone.
- `ec2:DescribeNetworkInterfaces`: To view and select existing network interfaces for the selected subnet.
- To add outbound rules to VPC security groups, users must be granted permission to use the `ec2:AuthorizeSecurityGroupEgress` API action. To modify or delete existing rules, users must be granted permission to use the relevant `ec2:RevokeSecurityGroup*` API action.
- `ec2:CreateTags`: To tag the resources that are created by `RunInstances`. For more information, see [Grant permission to tag resources during creation \(p. 1599\)](#). If users do not have permission to use this action and they attempt to apply tags on the tagging page of the launch instance wizard, the launch fails.

Important

Specifying a **Name** while launching an instance creates a tag and requires the `ec2:CreateTags` action. Be careful about granting users permission to use the `ec2:CreateTags` action, because doing so limits your ability to use the `aws:ResourceTag` condition key to restrict their use of other resources. If you grant users permission to use the `ec2:CreateTags` action, they can change a resource's tag in order to bypass those restrictions. For more information, see [Control access to EC2 resources using resource tags \(p. 1601\)](#).

- To use Systems Manager parameters when selecting an AMI, you must add `ssm:DescribeParameters` and `ssm:GetParameters` to your policy. `ssm:DescribeParameters` grants your users the permission to view and select Systems Manager parameters. `ssm:GetParameters` grants your users the permission to get the values of the Systems Manager parameters. You can also restrict access to specific Systems Manager parameters. For more information, see **Restrict access to specific Systems Manager parameters** later in this section.

Currently, the Amazon EC2 Describe* API actions do not support resource-level permissions, so you cannot restrict which individual resources users can view in the launch instance wizard. However, you can apply resource-level permissions on the ec2:RunInstances API action to restrict which resources users can use to launch an instance. The launch fails if users select options that they are not authorized to use.

Restrict access to a specific instance type, subnet, and Region

The following policy allows users to launch t2.micro instances using AMIs owned by Amazon, and only into a specific subnet (subnet-1a2b3c4d). Users can only launch in the sa-east-1 Region. If users select a different Region, or select a different instance type, AMI, or subnet in the launch instance wizard, the launch fails.

The first statement grants users permission to view the options in the launch instance wizard or to create new ones, as explained in the example above. The second statement grants users permission to use the network interface, volume, key pair, security group, and subnet resources for the ec2:RunInstances action, which are required to launch an instance into a VPC. For more information about using the ec2:RunInstances action, see [Launch instances \(RunInstances\) \(p. 1614\)](#). The third and fourth statements grant users permission to use the instance and AMI resources respectively, but only if the instance is a t2.micro instance, and only if the AMI is owned by Amazon, or certain trusted and verified partners.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:DescribeImages",  
                "ec2:DescribeInstanceTypes",  
                "ec2:DescribeKeyPairs",  
                "ec2:CreateKeyPair",  
                "ec2:DescribeVpcs",  
                "ec2:DescribeSubnets",  
                "ec2:DescribeSecurityGroups",  
                "ec2:CreateSecurityGroup",  
                "ec2:AuthorizeSecurityGroupIngress"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:sa-east-1:111122223333:network-interface/*",  
                "arn:aws:ec2:sa-east-1:111122223333:volume/*",  
                "arn:aws:ec2:sa-east-1:111122223333:key-pair/*",  
                "arn:aws:ec2:sa-east-1:111122223333:security-group/*",  
                "arn:aws:ec2:sa-east-1:111122223333:subnet/subnet-1a2b3c4d"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:sa-east-1:111122223333:instance/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "ec2:InstanceType": "t2.micro"  
                }  
            }  
        },  
        {  
    ]  
}
```

```
"Effect": "Allow",
"Action": "ec2:RunInstances",
"Resource": [
    "arn:aws:ec2:sa-east-1::image/ami-*"
],
"Condition": {
    "StringEquals": {
        "ec2:Owner": "amazon"
    }
}
}
```

Restrict access to specific Systems Manager parameters

The following policy grants access to use Systems Manager parameters with a specific name.

The first statement grants users the permission to view Systems Manager parameters when selecting an AMI in the launch instance wizard. The second statement grants users the permission to only use parameters that are named prod-*.

```
{
    "Version": "2012-10-17",
    "Statement": [{
        "Effect": "Allow",
        "Action": [
            "ssm:DescribeParameters"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": [
            "ssm:GetParameters"
        ],
        "Resource": "arn:aws:ssm:us-east-2:123456123:parameter/prod-*"
    }
]}
```

Example: Work with volumes

The following policy grants users permission to view and create volumes, and attach and detach volumes to specific instances.

Users can attach any volume to instances that have the tag "purpose=test", and also detach volumes from those instances. To attach a volume using the Amazon EC2 console, it is helpful for users to have permission to use the ec2:DescribeInstances action, as this allows them to select an instance from a pre-populated list in the **Attach Volume** dialog box. However, this also allows users to view all instances on the **Instances** page in the console, so you can omit this action.

In the first statement, the ec2:DescribeAvailabilityZones action is necessary to ensure that a user can select an Availability Zone when creating a volume.

Users cannot tag the volumes that they create (either during or after volume creation).

```
{
    "Version": "2012-10-17",
    "Statement": [{
```

```
"Effect": "Allow",
"Action": [
    "ec2:DescribeVolumes",
    "ec2:DescribeAvailabilityZones",
    "ec2>CreateVolume",
    "ec2:DescribeInstances"
],
"Resource": "*"
},
{
    "Effect": "Allow",
    "Action": [
        "ec2:AttachVolume",
        "ec2:DetachVolume"
    ],
    "Resource": "arn:aws:ec2:region:111122223333:instance/*",
    "Condition": {
        "StringEquals": {
            "aws:ResourceTag/purpose": "test"
        }
    }
},
{
    "Effect": "Allow",
    "Action": [
        "ec2:AttachVolume",
        "ec2:DetachVolume"
    ],
    "Resource": "arn:aws:ec2:region:111122223333:volume/*"
}
]
```

Example: Work with security groups

View security groups and add and remove rules

The following policy grants users permission to view security groups in the Amazon EC2 console, to add and remove inbound and outbound rules, and to list and modify rule descriptions for existing security groups that have the tag Department=Test.

In the first statement, the ec2:DescribeTags action allows users to view tags in the console, which makes it easier for users to identify the security groups that they are allowed to modify.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeSecurityGroupRules",
                "ec2:DescribeTags"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AuthorizeSecurityGroupIngress",
                "ec2:RevokeSecurityGroupIngress",
                "ec2:AuthorizeSecurityGroupEgress",
                "ec2:RevokeSecurityGroupEgress",
                "ec2:ModifySecurityGroupRules",
                "ec2:CreateSecurityGroup"
            ],
            "Resource": "*"
        }
    ]
}
```

```
        "ec2:UpdateSecurityGroupRuleDescriptionsIngress",
        "ec2:UpdateSecurityGroupRuleDescriptionsEgress"
    ],
    "Resource": [
        "arn:aws:ec2:region:111122223333:security-group/*"
    ],
    "Condition": {
        "StringEquals": {
            "aws:ResourceTag/Department": "Test"
        }
    }
},
{
    "Effect": "Allow",
    "Action": [
        "ec2:ModifySecurityGroupRules"
    ],
    "Resource": [
        "arn:aws:ec2:region:111122223333:security-group-rule/*"
    ]
}
]
```

Work with the Create Security Group dialog box

You can create a policy that allows users to work with the **Create Security Group** dialog box in the Amazon EC2 console. To use this dialog box, users must be granted permission to use at least the following API actions:

- `ec2:CreateSecurityGroup`: To create a new security group.
- `ec2:DescribeVpcs`: To view a list of existing VPCs in the **VPC** list.

With these permissions, users can create a new security group successfully, but they cannot add any rules to it. To work with rules in the **Create Security Group** dialog box, you can add the following API actions to your policy:

- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.
- `ec2:AuthorizeSecurityGroupEgress`: To add outbound rules to VPC security groups.
- `ec2:RevokeSecurityGroupIngress`: To modify or delete existing inbound rules. This is useful to allow users to use the **Copy to new** feature in the console. This feature opens the **Create Security Group** dialog box and populates it with the same rules as the security group that was selected.
- `ec2:RevokeSecurityGroupEgress`: To modify or delete outbound rules for VPC security groups. This is useful to allow users to modify or delete the default outbound rule that allows all outbound traffic.
- `ec2:DeleteSecurityGroup`: To cater for when invalid rules cannot be saved. The console first creates the security group, and then adds the specified rules. If the rules are invalid, the action fails, and the console attempts to delete the security group. The user remains in the **Create Security Group** dialog box so that they can correct the invalid rule and try to create the security group again. This API action is not required, but if a user is not granted permission to use it and attempts to create a security group with invalid rules, the security group is created without any rules, and the user must add them afterward.
- `ec2:UpdateSecurityGroupRuleDescriptionsIngress`: To add or update descriptions of ingress (inbound) security group rules.
- `ec2:UpdateSecurityGroupRuleDescriptionsEgress`: To add or update descriptions of egress (outbound) security group rules.
- `ec2:ModifySecurityGroupRules`: To modify security group rules.
- `ec2:DescribeSecurityGroupRules`: To list security group rules.

The following policy grants users permission to use the **Create Security Group** dialog box, and to create inbound and outbound rules for security groups that are associated with a specific VPC (vpc-1a2b3c4d). Users can create security groups for a VPC, but they cannot add any rules to them. Similarly, users cannot add any rules to any existing security group that's not associated with VPC vpc-1a2b3c4d. Users are also granted permission to view all security groups in the console. This makes it easier for users to identify the security groups to which they can add inbound rules. This policy also grants users permission to delete security groups that are associated with VPC vpc-1a2b3c4d.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeSecurityGroups",  
                "ec2:CreateSecurityGroup",  
                "ec2:DescribeVpcs"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>DeleteSecurityGroup",  
                "ec2:AuthorizeSecurityGroupIngress",  
                "ec2:AuthorizeSecurityGroupEgress"  
            ],  
            "Resource": "arn:aws:ec2:region:111122223333:security-group/*",  
            "Condition": {  
                "ArnEquals": {  
                    "ec2:Vpc": "arn:aws:ec2:region:111122223333:vpc/vpc-1a2b3c4d"  
                }  
            }  
        }  
    ]  
}
```

Example: Work with Elastic IP addresses

To allow users to view Elastic IP addresses in the Amazon EC2 console, you must grant users permission to use the `ec2:DescribeAddresses` action.

To allow users to work with Elastic IP addresses, you can add the following actions to your policy.

- `ec2:AllocateAddress`: To allocate an Elastic IP address.
- `ec2:ReleaseAddress`: To release an Elastic IP address.
- `ec2:AssociateAddress`: To associate an Elastic IP address with an instance or a network interface.
- `ec2:DescribeNetworkInterfaces` and `ec2:DescribeInstances`: To work with the **Associate address** screen. The screen displays the available instances or network interfaces to which you can associate an Elastic IP address.
- `ec2:DisassociateAddress`: To disassociate an Elastic IP address from an instance or a network interface.

The following policy allows users to view, allocate, and associate Elastic IP addresses with instances. Users cannot associate Elastic IP addresses with network interfaces, disassociate Elastic IP addresses, or release them.

```
{  
    "Version": "2012-10-17",
```

```
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "ec2:DescribeAddresses",
            "ec2:AllocateAddress",
            "ec2:DescribeInstances",
            "ec2:AssociateAddress"
        ],
        "Resource": "*"
    }
]
```

Example: Work with Reserved Instances

The following policy allows users to view and modify Reserved Instances in your account, as well as purchase new Reserved Instances in the AWS Management Console.

This policy allows users to view all the Reserved Instances, as well as On-Demand Instances, in the account. It's not possible to set resource-level permissions for individual Reserved Instances.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeReservedInstances",
                "ec2:ModifyReservedInstances",
                "ec2:PurchaseReservedInstancesOffering",
                "ec2:DescribeInstances",
                "ec2:DescribeInstanceTypes",
                "ec2:DescribeAvailabilityZones",
                "ec2:DescribeReservedInstancesOfferings"
            ],
            "Resource": "*"
        }
    ]
}
```

The `ec2:DescribeAvailabilityZones` action is necessary to ensure that the Amazon EC2 console can display information about the Availability Zones in which you can purchase Reserved Instances. The `ec2:DescribeInstances` action is not required, but ensures that the user can view the instances in the account and purchase reservations to match the correct specifications.

You can adjust the API actions to limit user access, for example removing `ec2:DescribeInstances` and `ec2:DescribeAvailabilityZones` means the user has read-only access.

AWS managed policies for Amazon Elastic Compute Cloud

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to [create IAM customer managed policies](#) that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see [AWS managed policies](#) in the *IAM User Guide*.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to

support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the **ReadOnlyAccess** AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see [AWS managed policies for job functions](#) in the *IAM User Guide*.

AWS managed policy: AmazonEC2FullAccess

You can attach the AmazonEC2FullAccess policy to your IAM identities. This policy grants permissions that allow full access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2FullAccess](#) in the *AWS Managed Policy Reference*.

AWS managed policy: AmazonEC2ReadOnlyAccess

You can attach the AmazonEC2ReadOnlyAccess policy to your IAM identities. This policy grants permissions that allow read-only access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2ReadOnlyAccess](#) in the *AWS Managed Policy Reference*.

AWS managed policy: AWSEC2CapacityReservationFleetRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2CapacityReservationFleet** to allow Capacity Reservations to create, modify, and cancel Capacity Reservations on your behalf. For more information, see [Service-linked role for Capacity Reservation Fleet \(p. 539\)](#).

AWS managed policy: AWSEC2FleetServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Fleet** to allow EC2 Fleet to request, launch, terminate, and tag instances on your behalf. For more information, see [Service-linked role for EC2 Fleet \(p. 1008\)](#).

AWS managed policy: AWSEC2SpotFleetServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2SpotFleet** to allow Spot Fleet to launch and manage instances on your behalf. For more information, see [Service-linked role for Spot Fleet \(p. 1054\)](#).

AWS managed policy: AWSEC2SpotServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Spot** to allow Amazon EC2 to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests \(p. 406\)](#).

AWS managed policy: EC2FastLaunchServiceRolePolicy

This policy is attached to the service-linked role named **AWSServiceRoleForEC2FastLaunch** to allow Amazon EC2 to create and manage a set of pre-provisioned snapshots that reduce the time it takes

to launch instances from your Windows faster launching-enabled AMI. For more information, see [the section called "Service-linked role for Windows Fast Launch" \(p. 54\)](#).

Amazon EC2 updates to AWS managed policies

View details about updates to AWS managed policies for Amazon EC2 since this service began tracking these changes.

Change	Description	Date
EC2FastLaunchServiceRolePolicy (p. 169) – New policy	Amazon EC2 added the Windows faster launching feature to enable Windows AMIs to launch instances faster by creating a set of pre-provisioned snapshots.	November 26, 2021
Amazon EC2 started tracking changes	Amazon EC2 started tracking changes to its AWS managed policies	March 1, 2021

IAM roles for Amazon EC2

Applications must sign their API requests with AWS credentials. Therefore, if you are an application developer, you need a strategy for managing credentials for your applications that run on EC2 instances. For example, you can securely distribute your AWS credentials to the instances, enabling the applications on those instances to use your credentials to sign requests, while protecting your credentials from other users. However, it's challenging to securely distribute credentials to each instance, especially those that AWS creates on your behalf, such as Spot Instances or instances in Auto Scaling groups. You must also be able to update the credentials on each instance when you rotate your AWS credentials.

Note

For your Amazon EC2 workloads, we recommend that you retrieve session credentials using the method described below. These credentials should enable your workload to make AWS API requests, without needing to use `sts:AssumeRole` to assume the same role that is already associated with the instance. Unless you need to pass session tags for attribute-based access control (ABAC) or pass a session policy to further restrict permissions of the role, such role assumption calls are unnecessary as they create a new set of the same temporary role session credentials.

If your workload uses a role to assume itself, you must create a trust policy that explicitly allows that role to assume itself. If you do not create the trust policy, you get the `AccessDenied` error. For more information, see [Modifying a role trust policy](#) in the *IAM User Guide*.

We designed IAM roles so that your applications can securely make API requests from your instances, without requiring you to manage the security credentials that the applications use. Instead of creating and distributing your AWS credentials, you can delegate permission to make API requests using IAM roles as follows:

1. Create an IAM role.
2. Define which accounts or AWS services can assume the role.
3. Define which API actions and resources the application can use after assuming the role.
4. Specify the role when you launch your instance, or attach the role to an existing instance.
5. Have the application retrieve a set of temporary credentials and use them.

For example, you can use IAM roles to grant permissions to applications running on your instances that need to use a bucket in Amazon S3. You can specify permissions for IAM roles by creating a policy in

JSON format. These are similar to the policies that you create for users. If you change a role, the change is propagated to all instances.

You can only attach one IAM role to an instance, but you can attach the same role to many instances. For more information about creating and using IAM roles, see [Roles](#) in the *IAM User Guide*.

You can apply resource-level permissions to your IAM policies to control the users' ability to attach, replace, or detach IAM roles for an instance. For more information, see [Supported resource-level permissions for Amazon EC2 API actions \(p. 1594\)](#) and the following example: [Example: Work with IAM roles \(p. 1633\)](#).

Contents

- [Instance profiles \(p. 1650\)](#)
- [Retrieve security credentials from instance metadata \(p. 1650\)](#)
- [Grant a user permission to pass an IAM role to an instance \(p. 1651\)](#)
- [Work with IAM roles \(p. 1652\)](#)

Instance profiles

Amazon EC2 uses an *instance profile* as a container for an IAM role. When you create an IAM role using the IAM console, the console creates an instance profile automatically and gives it the same name as the role to which it corresponds. If you use the Amazon EC2 console to launch an instance with an IAM role or to attach an IAM role to an instance, you choose the role based on a list of instance profile names.

If you use the AWS CLI, API, or an AWS SDK to create a role, you create the role and instance profile as separate actions, with potentially different names. If you then use the AWS CLI, API, or an AWS SDK to launch an instance with an IAM role or to attach an IAM role to an instance, specify the instance profile name.

An instance profile can contain only one IAM role. This limit cannot be increased.

For more information, see [Instance Profiles](#) in the *IAM User Guide*.

Retrieve security credentials from instance metadata

An application on the instance retrieves the security credentials provided by the role from the instance metadata item `iam/security-credentials/role-name`. The application is granted the permissions for the actions and resources that you've defined for the role through the security credentials associated with the role. These security credentials are temporary and we rotate them automatically. We make new credentials available at least five minutes before the expiration of the old credentials.

Warning

If you use services that use instance metadata with IAM roles, ensure that you don't expose your credentials when the services make HTTP calls on your behalf. The types of services that could expose your credentials include HTTP proxies, HTML/CSS validator services, and XML processors that support XML inclusion.

The following command retrieves the security credentials for an IAM role named `s3access`.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/iam/security-credentials/s3access
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/security-credentials/s3access
```

The following is example output.

```
{  
    "Code" : "Success",  
    "LastUpdated" : "2012-04-26T16:39:16Z",  
    "Type" : "AWS-HMAC",  
    "AccessKeyId" : "ASIAIOSFODNN7EXAMPLE",  
    "SecretAccessKey" : "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",  
    "Token" : "token",  
    "Expiration" : "2017-05-17T15:09:54Z"  
}
```

For applications, AWS CLI, and Tools for Windows PowerShell commands that run on the instance, you do not have to explicitly get the temporary security credentials—the AWS SDKs, AWS CLI, and Tools for Windows PowerShell automatically get the credentials from the EC2 instance metadata service and use them. To make a call outside of the instance using temporary security credentials (for example, to test IAM policies), you must provide the access key, secret key, and the session token. For more information, see [Using Temporary Security Credentials to Request Access to AWS Resources](#) in the *IAM User Guide*.

For more information about instance metadata, see [Instance metadata and user data \(p. 862\)](#). For information about the instance metadata IP address, see [Retrieve instance metadata \(p. 876\)](#).

Grant a user permission to pass an IAM role to an instance

To enable a user to launch an instance with an IAM role or to attach or replace an IAM role for an existing instance, you must grant the user permission to use the following API actions:

- `iam:PassRole`
- `ec2:AssociateIamInstanceProfile`
- `ec2:ReplaceIamInstanceProfileAssociation`

For example, the following IAM policy grants users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the AWS CLI.

Note

If you want the policy to grant users access to all of your roles, specify the resource as `*` in the policy. However, please consider the principle of [least privilege](#) as a best-practice .

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances",  
                "ec2:AssociateIamInstanceProfile",  
                "ec2:ReplaceIamInstanceProfileAssociation"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "*"  
        }  
    ]  
}
```

```
        "Resource": "arn:aws:iam::123456789012:role/DevTeam*"
    }
]
```

To grant users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the Amazon EC2 console, you must grant them permission to use `iam>ListInstanceProfiles`, `iam:PassRole`, `ec2:AssociateIamInstanceProfile`, and `ec2:ReplaceIamInstanceProfileAssociation` in addition to any other permissions they might need. For example policies, see [Example policies for working in the Amazon EC2 console \(p. 1639\)](#).

Work with IAM roles

You can create an IAM role and attach it to an instance during or after launch. You can also replace or detach an IAM role for an instance.

Contents

- [Create an IAM role \(p. 1652\)](#)
- [Launch an instance with an IAM role \(p. 1654\)](#)
- [Attach an IAM role to an instance \(p. 1656\)](#)
- [Replace an IAM role \(p. 1657\)](#)
- [Detach an IAM role \(p. 1658\)](#)
- [Generate a policy for your IAM role based on access activity \(p. 1659\)](#)

Create an IAM role

You must create an IAM role before you can launch an instance with that role or attach it to an instance.

Console

To create an IAM role using the IAM console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles** then choose **Create role**.
3. On the **Select trusted entity** page, choose **AWS service**, and then select the **EC2** use case. Choose **Next**.
4. On the **Add permissions** page, select the policies that grants your instances access to the resources that they need. Choose **Next**.
5. On the **Name, review, and create** page, enter a name and description for the role. Optionally, add tags to the role. Choose **Create role**.

Command line

The following example creates an IAM role with a policy that allows the role to use an Amazon S3 bucket.

To create an IAM role and instance profile (AWS CLI)

1. Create the following trust policy and save it in a text file named `ec2-role-trust-policy.json`.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
```

```
        "Effect": "Allow",
        "Principal": { "Service": "ec2.amazonaws.com" },
        "Action": "sts:AssumeRole"
    }
]
```

2. Create the s3access role and specify the trust policy that you created using the [create-role](#) command.

```
aws iam create-role \
--role-name s3access \
--assume-role-policy-document file://ec2-role-trust-policy.json
```

Example response

```
{
    "Role": {
        "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Action": "sts:AssumeRole",
                    "Effect": "Allow",
                    "Principal": {
                        "Service": "ec2.amazonaws.com"
                    }
                }
            ]
        },
        "RoleId": "AROAIIZKPBK52LEXAMPLE",
        "CreateDate": "2013-12-12T23:46:37.247Z",
        "RoleName": "s3access",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/s3access"
    }
}
```

3. Create an access policy and save it in a text file named ec2-role-access-policy.json. For example, this policy grants administrative permissions for Amazon S3 to applications running on the instance.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:*"],
            "Resource": ["*"]
        }
    ]
}
```

4. Attach the access policy to the role using the [put-role-policy](#) command.

```
aws iam put-role-policy \
--role-name s3access \
--policy-name S3-Permissions \
--policy-document file://ec2-role-access-policy.json
```

5. Create an instance profile named s3access-profile using the [create-instance-profile](#) command.

```
aws iam create-instance-profile --instance-profile-name s3access-profile
```

Example response

```
{  
    "InstanceProfile": {  
        "InstanceProfileId": "AIPAJTLBPJLEGREXAMPLE",  
        "Roles": [],  
        "CreateDate": "2013-12-12T23:53:34.093Z",  
        "InstanceProfileName": "s3access-profile",  
        "Path": "/",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/s3access-profile"  
    }  
}
```

6. Add the s3access role to the s3access-profile instance profile.

```
aws iam add-role-to-instance-profile \  
    --instance-profile-name s3access-profile \  
    --role-name s3access
```

Alternatively, you can use the following AWS Tools for Windows PowerShell commands:

- [New-IAMRole](#)
- [Register-IAMRolePolicy](#)
- [New-IAIMInstanceProfile](#)

Launch an instance with an IAM role

After you've created an IAM role, you can launch an instance, and associate that role with the instance during launch.

Important

After you create an IAM role, it might take several seconds for the permissions to propagate. If your first attempt to launch an instance with a role fails, wait a few seconds before trying again. For more information, see [Troubleshooting IAM roles](#) in the *IAM User Guide*.

New console

To launch an instance with an IAM role (console)

1. Follow the procedure to [launch an instance \(p. 554\)](#).
2. Expand **Advanced details**, and for **IAM instance profile**, select the IAM role that you created.

Note

The **IAM instance profile** list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile was created for you and given the same name as the role. If you created your IAM role using the AWS CLI, API, or an AWS SDK, you may have named your instance profile differently.

3. Configure any other details that you require for your instance or accept the defaults, and select a key pair. For information about the fields in the launch instance wizard, see [Launch an instance using defined parameters \(p. 554\)](#).
4. In the **Summary** panel, review your instance configuration, and then choose **Launch instance**.

5. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Old console

To launch an instance with an IAM role (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the dashboard, choose **Launch instance**.
3. Select an AMI and instance type and then choose **Next: Configure Instance Details**.
4. On the **Configure Instance Details** page, for **IAM role**, select the IAM role that you created.

Note

The **IAM role** list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile was created for you and given the same name as the role. If you created your IAM role using the AWS CLI, API, or an AWS SDK, you may have named your instance profile differently.

5. Configure any other details, then follow the instructions through the rest of the wizard, or choose **Review and Launch** to accept default settings and go directly to the **Review Instance Launch** page.
6. Review your settings, then choose **Launch** to choose a key pair and launch your instance.
7. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @ {"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @ {"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Command line

You can use the AWS CLI to associate a role with an instance during launch. You must specify the instance profile in the command.

To launch an instance with an IAM role (AWS CLI)

1. Use the [run-instances](#) command to launch an instance using the instance profile. The following example shows how to launch an instance with the instance profile.

```
aws ec2 run-instances \
--image-id ami-11aa22bb \
--iam-instance-profile Name="s3access-profile" \
--key-name my-key-pair \
--security-groups my-security-group \
--subnet-id subnet-1a2b3c4d
```

Alternatively, use the [New-EC2Instance](#) Tools for Windows PowerShell command.

2. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

```
curl http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Attach an IAM role to an instance

To attach an IAM role to an instance that has no role, the instance can be in the stopped or running state.

Console

To attach an IAM role to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Command line

To attach an IAM role to an instance (AWS CLI)

1. If required, describe your instances to get the ID of the instance to which to attach the role.

```
aws ec2 describe-instances
```

2. Use the [associate-iam-instance-profile](#) command to attach the IAM role to the instance by specifying the instance profile. You can use the Amazon Resource Name (ARN) of the instance profile, or you can use its name.

```
aws ec2 associate-iam-instance-profile \
--instance-id i-1234567890abcdef0 \
--iam-instance-profile Name="TestRole-1"
```

Example response

```
{  
    "IamInstanceProfileAssociation": {  
        "InstanceId": "i-1234567890abcdef0",  
        "State": "associating",  
        "AssociationId": "iip-assoc-0dbd8529a48294120",  
        "IamInstanceProfile": {  
            "Id": "AIPAJLNLDX3AMYZNWYYAY",  
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-1"  
        }  
    }  
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2Instance](#)
- [Register-EC2IamInstanceProfile](#)

Replace an IAM role

To replace the IAM role on an instance that already has an attached IAM role, the instance must be in the running state. You can do this if you want to change the IAM role for an instance without detaching the existing one first. For example, you can do this to ensure that API actions performed by applications running on the instance are not interrupted.

Console

To replace an IAM role for an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Command line

To replace an IAM role for an instance (AWS CLI)

1. If required, describe your IAM instance profile associations to get the association ID for the IAM instance profile to replace.

```
aws ec2 describe-iam-instance-profile-associations
```

2. Use the [replace-iam-instance-profile-association](#) command to replace the IAM instance profile by specifying the association ID for the existing instance profile and the ARN or name of the instance profile that should replace it.

```
aws ec2 replace-iam-instance-profile-association \
--association-id iip-assoc-0044d817db6c0a4ba \
--iam-instance-profile Name="TestRole-2"
```

Example response

```
{  
    "IamInstanceProfileAssociation": {  
        "InstanceId": "i-087711ddaf98f9489",  
        "State": "associating",  
        "AssociationId": "iip-assoc-09654be48e33b91e0",  
        "IamInstanceProfile": {  
            "Id": "AIPAJCJEDKX7QYHWYK7GS",  
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"  
        }  
    }  
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Set-EC2IamInstanceProfileAssociation](#)

Detach an IAM role

You can detach an IAM role from a running or stopped instance.

Console

To detach an IAM role from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions**, **Security**, **Modify IAM role**.
4. For **IAM role**, choose **No IAM Role**. Choose **Save**.
5. In the confirmation dialog box, enter **Detach**, and then choose **Detach**.

Command line

To detach an IAM role from an instance (AWS CLI)

1. If required, use [describe-iam-instance-profile-associations](#) to describe your IAM instance profile associations and get the association ID for the IAM instance profile to detach.

```
aws ec2 describe-iam-instance-profile-associations
```

Example response

```
{  
    "IamInstanceProfileAssociations": [  
        {  
            "InstanceId": "i-088ce778fbfeb4361",  
            "State": "associated",  
            "AssociationId": "iip-assoc-0044d817db6c0a4ba",  
        }  
    ]  
}
```

```
        "IamInstanceProfile": {
            "Id": "AIPAJEDNCAA64SSD265D6",
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"
        }
    }
}
```

2. Use the [disassociate-iam-instance-profile](#) command to detach the IAM instance profile using its association ID.

```
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-0044d817db6c0a4ba
```

Example response

```
{  
    "IamInstanceProfileAssociation": {  
        "InstanceId": "i-087711ddaf98f9489",  
        "State": "disassociating",  
        "AssociationId": "iip-assoc-0044d817db6c0a4ba",  
        "IamInstanceProfile": {  
            "Id": "AIPAJEDNCAA64SSD265D6",  
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"  
        }  
    }  
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Unregister-EC2IamInstanceProfile](#)

Generate a policy for your IAM role based on access activity

When you first create an IAM role for your applications, you might sometimes grant permissions beyond what is required. Before launching your application in your production environment, you can generate an IAM policy that is based on the access activity for an IAM role. IAM Access Analyzer reviews your AWS CloudTrail logs and generates a policy template that contains the permissions that have been used by the role in your specified date range. You can use the template to create a managed policy with fine-grained permissions and then attach it to the IAM role. That way, you grant only the permissions that the role needs to interact with AWS resources for your specific use case. This helps you adhere to the best practice of [granting least privilege](#). To learn more, see [Generate policies based on access activity](#) in the [IAM User Guide](#).

Authorize inbound traffic for your Windows instances

Security groups enable you to control traffic to your instance, including the kind of traffic that can reach your instance. For example, you can allow computers from only your home network to access your instance using RDP. If your instance is a web server, you can allow all IP addresses to access your instance using HTTP or HTTPS, so that external users can browse the content on your web server.

Your default security groups and newly created security groups include default rules that do not enable you to access your instance from the internet. For more information, see [Default security groups \(p. 1680\)](#) and [Custom security groups \(p. 1680\)](#). To enable network access to your instance, you must allow inbound traffic to your instance. To open a port for inbound traffic, add a rule to a security group that you associated with your instance when you launched it.

To connect to your instance, you must set up a rule to authorize RDP traffic from your computer's public IPv4 address. To allow RDP traffic from additional IP address ranges, add another rule for each range you need to authorize.

If you've enabled your VPC for IPv6 and launched your instance with an IPv6 address, you can connect to your instance using its IPv6 address instead of a public IPv4 address. Your local computer must have an IPv6 address and must be configured to use IPv6.

If you need to enable network access to a Linux instance, see [Authorizing inbound traffic for your Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Before you start

Decide who requires access to your instance; for example, a single host or a specific network that you trust such as your local computer's public IPv4 address. The security group editor in the Amazon EC2 console can automatically detect the public IPv4 address of your local computer for you. Alternatively, you can use the search phrase "what is my IP address" in an internet browser, or use the following service: [Check IP](#). If you are connecting through an ISP or from behind your firewall without a static IP address, you need to find out the range of IP addresses used by client computers.

Warning

If you use `0.0.0.0/0`, you enable all IPv4 addresses to access your instance using RDP. If you use `::/0`, you enable all IPv6 addresses to access your instance. You should authorize only a specific IP address or range of addresses to access your instance.

Windows Firewall may also block incoming traffic. If you're having trouble setting up access to your instance, you may have to disable Windows Firewall. For more information, see [Remote Desktop can't connect to the remote computer \(p. 2119\)](#).

Add a rule for inbound RDP traffic to a Windows instance

Security groups act as a firewall for associated instances, controlling both inbound and outbound traffic at the instance level. You must add rules to a security group to enable you to connect to your Windows instance from your IP address using RDP.

To add a rule to a security group for inbound RDP traffic over IPv4 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the top navigation bar, select a Region for the security group. Security groups are specific to a Region, so you should select the same Region in which you created your instance.
3. In the navigation pane, choose **Instances**.
4. Select your instance and, in bottom half of the screen, choose the **Security** tab. **Security groups** lists the security groups that are associated with the instance. **Inbound rules** displays a list of the inbound rules that are in effect for the instance.
5. For the security group to which you'll add the new rule, choose the security group ID link to open the security group.
6. On the **Inbound rules** tab, choose **Edit inbound rules**.
7. On the **Edit inbound rules** page, do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **RDP**.
 - c. For **Source**, choose **My IP** to automatically populate the field with the public IPv4 address of your local computer.

Alternatively, for **Source**, choose **Custom** and enter the public IPv4 address of your computer or network in CIDR notation. For example, if your IPv4 address is `203.0.113.25`, enter

203.0.113.25/32 to list this single IPv4 address in CIDR notation. If your company allocates addresses from a range, enter the entire range, such as 203.0.113.0/24.

For information about finding your IP address, see [Before you start \(p. 1660\)](#).

- d. Choose **Save rules**.

If you launched an instance with an IPv6 address and want to connect to your instance using its IPv6 address, you must add rules that allow inbound IPv6 traffic over RDP.

To add a rule to a security group for inbound RDP traffic over IPv6 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the top navigation bar, select a Region for the security group. Security groups are specific to a Region, so you should select the same Region in which you created your instance.
3. In the navigation pane, choose **Instances**.
4. Select your instance and, in bottom half of the screen, choose the **Security** tab. **Security groups** lists the security groups that are associated with the instance. **Inbound rules** displays a list of the inbound rules that are in effect for the instance.
5. For the security group to which you'll add the new rule, choose the security group ID link to open the security group.
6. On the **Inbound rules** tab, choose **Edit inbound rules**.
7. On the **Edit inbound rules** page, do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **RDP**.
 - c. For **Source**, choose **Custom** and enter the IPv6 address of your computer in CIDR notation. For example, if your IPv6 address is 2001:db8:1234:1a00:9691:9503:25ad:1761, enter 2001:db8:1234:1a00:9691:9503:25ad:1761/128 to list the single IP address in CIDR notation. If your company allocates addresses from a range, enter the entire range, such as 2001:db8:1234:1a00::/64.
 - d. Choose **Save rules**.

Note

Be sure to run the following commands on your local system, not on the instance itself. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

To add a rule to a security group using the command line

1. Find the security group that is associated with your instance using one of the following commands:
 - [describe-instance-attribute](#) (AWS CLI)

```
aws ec2 describe-instance-attribute --region region --instance-id instance_id --  
attribute groupSet
```

- [Get-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
PS C:\> (Get-EC2InstanceAttribute -Region region -InstanceId instance_id -Attribute  
groupSet).Groups
```

Both commands return a security group ID, which you use in the next step.

2. Add the rule to the security group using one of the following commands:

- [authorize-security-group-ingress](#) (AWS CLI)

```
aws ec2 authorize-security-group-ingress --region region --group-id security_group_id
--protocol tcp --port 3389 --cidr cidr_ip_range
```

- [Grant-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

The Grant-EC2SecurityGroupIngress command needs an IpPermission parameter, which describes the protocol, port range, and IP address range to be used for the security group rule. The following command creates the IpPermission parameter:

```
PS C:\> $ip1 = @{ IpProtocol="tcp"; FromPort="3389"; ToPort="3389";
IpRanges="cidr_ip_range" }
```

```
PS C:\> Grant-EC2SecurityGroupIngress -Region region -GroupId security_group_id -
IpPermission @($ip1)
```

Assign a security group to an instance

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group.

After you launch an instance, you can change its security groups. For more information, see [the section called "Change an instance's security group" \(p. 1687\)](#).

Amazon EC2 key pairs and Windows instances

A key pair, consisting of a public key and a private key, is a set of security credentials that you use to prove your identity when connecting to an Amazon EC2 instance. Amazon EC2 stores the public key on your instance, and you store the private key. For Windows instances, the private key is required to decrypt the administrator password. You then use the decrypted password to connect to your instance. As an alternative to key pairs, you can use [AWS Systems Manager Session Manager](#) to connect to your instance with an interactive one-click browser-based shell or the AWS Command Line Interface (AWS CLI).

Anyone who possesses your private key can connect to your instances, so it's important that you store your private key in a secure place.

When you launch an instance, you can [specify a key pair \(p. 556\)](#). If you plan to connect to the instance using RDP, you must specify a key pair. You can choose an existing key pair or create a new one. Depending on how you manage your security, you can specify the same key pair for all your instances or you can specify different key pairs. With Windows instances, you use the private key to obtain the administrator password and then log in using RDP. For more information about connecting to your instance, see [Connect to your Windows instance \(p. 626\)](#). For more information about key pairs and Linux instances, see [Amazon EC2 key pairs and Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

Because Amazon EC2 doesn't keep a copy of your private key, there is no way to recover a private key if you lose it. However, there can still be a way to connect to instances for which you've lost the private key. For more information, see [I've lost my private key. How can I connect to my Windows instance? \(p. 2126\)](#)

You can use Amazon EC2 to create your key pairs. You can also use a third-party tool to create your key pairs, and then import the public keys to Amazon EC2.

Amazon EC2 supports 2048-bit SSH-2 RSA keys for Windows instances. ED25519 keys are not supported for Windows instances.

You can have up to 5,000 key pairs per Region.

Contents

- [Create key pairs \(p. 1663\)](#)
- [Tag a public key \(p. 1667\)](#)
- [Describe public keys \(p. 1669\)](#)
- [Delete your public key on Amazon EC2 \(p. 1672\)](#)
- [Verify the fingerprint of your key pair \(p. 1673\)](#)

Create key pairs

You can use Amazon EC2 to create an RSA or ED25519 key pair, or you can use a third-party tool to create a key pair and then import the public key to Amazon EC2.

For steps to connect to your Windows instance using RDP after you have created a key pair, see [Connect to your Windows instance](#).

Contents

- [Create a key pair using Amazon EC2 \(p. 1663\)](#)
- [Create a key pair using AWS CloudFormation \(p. 1665\)](#)
- [Create a key pair using a third-party tool and import the public key to Amazon EC2 \(p. 1666\)](#)

Create a key pair using Amazon EC2

When you create a key pair using Amazon EC2, the public key is stored in Amazon EC2, and you store the private key.

You can use Amazon EC2 to create a key pair using one of the following methods.

Console

To create a key pair using Amazon EC2

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, under **Network & Security**, choose **Key Pairs**.
3. Choose **Create key pair**.
4. For **Name**, enter a descriptive name for the key pair. Amazon EC2 associates the public key with the name that you specify as the key name. A key name can include up to 255 ASCII characters. It can't include leading or trailing spaces.
5. For **Key pair type**, choose **RSA**. Note that **ED25519** keys are not supported for Windows instances.
6. For **Private key file format**, choose the format in which to save the private key. To save the private key in a format that can be used with OpenSSH, choose **pem**. To save the private key in a format that can be used with PuTTY, choose **ppk**.
7. To add a tag to the public key, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.
8. Choose **Create key pair**.

9. The private key file is automatically downloaded by your browser. The base file name is the name that you specified as the name of your key pair, and the file name extension is determined by the file format that you chose. Save the private key file in a safe place.

Important

This is the only chance for you to save the private key file.

AWS CLI

To create a key pair using Amazon EC2

- Use the [create-key-pair](#) command as follows to generate the key pair and to save the private key to a .pem file.

For --key-name, specify a name for the public key. The name can be up to 255 ASCII characters.

For --key-type, specify either rsa or ed25519. If you do not include the --key-type parameter, an rsa key is created by default. Note that ED25519 keys are not supported for Windows instances.

For --key-format, specify either pem or ppk. If you do not include the --key-format parameter, a pem file is created by default.

--query "KeyMaterial" prints the private key material to the output.

--output text > *my-key-pair.pem* saves the private key material in a file with the specified extension. The extension can be either .pem or .ppk. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
aws ec2 create-key-pair \
--key-name my-key-pair \
--key-type rsa \
--key-format pem \
--query "KeyMaterial" \
--output text > my-key-pair.pem
```

PowerShell

To create a key pair using Amazon EC2

Use the [New-EC2KeyPair](#) AWS Tools for Windows PowerShell command as follows to generate the key and save it to a .pem or .ppk file.

For -KeyName, specify a name for the public key. The name can be up to 255 ASCII characters.

For -KeyType, specify either rsa or ed25519. If you do not include the -KeyType parameter, an rsa key is created by default. Note that ED25519 keys are not supported for Windows instances.

For -KeyFormat, specify either pem or ppk. If you do not include the -KeyFormat parameter, a pem file is created by default.

KeyMaterial prints the private key material to the output.

Out-File -Encoding ascii -FilePath *C:\path\my-key-pair.pem* saves the private key material in a file with the the specified extension. The extension can be .pem or .ppk. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
PS C:\> (New-EC2KeyPair -KeyName "my-key-pair" -KeyType "rsa" -KeyFormat "pem").KeyMaterial | Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem
```

Create a key pair using AWS CloudFormation

When you create a new key pair using AWS CloudFormation, the private key is saved to AWS Systems Manager Parameter Store. The parameter name has the following format:

```
/ec2/keypair/key_pair_id
```

For more information, see [AWS Systems Manager Parameter Store](#) in the *AWS Systems Manager User Guide*.

To create a key pair using AWS CloudFormation

1. Specify the [AWS::EC2::KeyPair](#) resource in your template.

```
Resources:  
  NewKeyPair:  
    Type: 'AWS::EC2::KeyPair'  
    Properties:  
      KeyName: new-key-pair
```

2. Use the [describe-key-pairs](#) command as follows to get the ID of the key pair.

```
aws ec2 describe-key-pairs --filters Name=key-name,Values=new-key-pair --query  
  KeyPairs[*].KeyId --output text
```

The following is example output.

```
key-05abb699beEXAMPLE
```

3. Use the [get-parameter](#) command as follows to get the parameter for your key and save the key material in a .pem file.

```
aws ssm get-parameter --name /ec2/keypair/key-05abb699beEXAMPLE --with-decryption --  
  query Parameter.Value --output text > new-key-pair.pem
```

Required IAM permissions

To enable AWS CloudFormation to manage Parameter Store parameters on your behalf, the IAM role assumed by AWS CloudFormation or your user must have the following permissions:

- `ssm:PutParameter` – Grants permission to create a parameter for the private key material.
- `ssm:DeleteParameter` – Grants permission to delete the parameter that stored the private key material. This permission is required whether the key pair was imported or created by AWS CloudFormation.

When AWS CloudFormation deletes a key pair that was created or imported by a stack, it performs a permissions check to determine whether you have permission to delete parameters, even though AWS CloudFormation creates a parameter only when it creates a key pair, not when it imports a key pair. AWS CloudFormation tests for the required permission using a fabricated parameter name that does

not match any parameter in your account. Therefore, you might see a fabricated parameter name in the `AccessDeniedException` error message.

Create a key pair using a third-party tool and import the public key to Amazon EC2

Instead of using Amazon EC2 to create your key pair, you can create an RSA key pair by using a third-party tool, and then import the public key to Amazon EC2.

Requirements for key pairs

- Supported types: RSA. Amazon EC2 does not accept DSA keys.

Note

ED25519 keys are not supported for Windows instances.

- Supported formats:

- OpenSSH public key format
- SSH private key file format must be PEM or PPK
- (RSA only) Base64 encoded DER format
- (RSA only) SSH public key file format as specified in [RFC 4716](#)
- Supported lengths: 1024, 2048, and 4096.

To create a key pair using a third-party tool

1. Generate a key pair with a third-party tool of your choice. For example, you can use `ssh-keygen` (a tool provided with the standard OpenSSH installation). Alternatively, Java, Ruby, Python, and many other programming languages provide standard libraries that you can use to create an RSA key pair.

Important

The private key must be in the PEM or PPK format. For example, use `ssh-keygen -m PEM` to generate the OpenSSH key in the PEM format.

2. Save the public key to a local file. For example, `C:\keys\my-key-pair.pub`. The file name extension for this file is not important.
3. Save the private key to a local file that has the `.pem` or `.ppk` extension. For example, `C:\keys\my-key-pair.pem` or `C:\keys\my-key-pair.ppk`. The file name extension for this file is important because only `.pem` files can be selected when connecting to your Windows instance from the EC2 console.

Important

Save the private key file in a safe place. You'll need to provide the name of your public key when you launch an instance, and the corresponding private key each time you connect to the instance.

After you have created the key pair, use one of the following methods to import your public key to Amazon EC2.

Console

To import the public key to Amazon EC2

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Choose **Import key pair**.
4. For **Name**, enter a descriptive name for the public key. The name can include up to 255 ASCII characters. It can't include leading or trailing spaces.

Note

When you connect to your instance from the EC2 console, the console suggests this name for the name of your private key file.

5. Either choose **Browse** to navigate to and select your public key, or paste the contents of your public key into the **Public key contents** field.
6. Choose **Import key pair**.
7. Verify that the public key that you imported appears in the list of key pairs.

AWS CLI

To import the public key to Amazon EC2

Use the [import-key-pair](#) AWS CLI command.

To verify that the key pair was imported successfully

Use the [describe-key-pairs](#) AWS CLI command.

PowerShell

To import the public key to Amazon EC2

Use the [Import-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

To verify that the key pair was imported successfully

Use the [Get-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

Tag a public key

To help categorize and manage the public keys that you've either created using Amazon EC2 or imported to Amazon EC2, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

You can view, add, and delete tags using one of the following methods.

Console

To view, add, or delete a tag for a public key

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Select a public key, and then choose **Actions, Manage tags**.
4. The **Manage tags** page displays any tags that are assigned to the public key.
 - To add a tag, choose **Add tag**, and then enter the tag key and value. You can add up to 50 tags per key. For more information, see [Tag restrictions \(p. 2089\)](#).
 - To delete a tag, choose **Remove** next to the tag to delete.
5. Choose **Save**.

AWS CLI

To view public key tags

Use the [describe-tags](#) AWS CLI command. In the following example, you describe the tags for all of your public keys.

```
C:\> aws ec2 describe-tags --filters "Name=resource-type,Values=key-pair"
```

```
{  
    "Tags": [  
        {  
            "Key": "Environment",  
            "ResourceId": "key-0123456789EXAMPLE",  
            "ResourceType": "key-pair",  
            "Value": "Production"  
        },  
        {  
            "Key": "Environment",  
            "ResourceId": "key-9876543210EXAMPLE",  
            "ResourceType": "key-pair",  
            "Value": "Production"  
        }]  
}
```

To describe the tags for a specific public key

Use the [describe-key-pairs](#) AWS CLI command.

```
C:\> aws ec2 describe-key-pairs --key-pair-ids key-0123456789EXAMPLE
```

```
{  
    "KeyPairs": [  
        {  
            "KeyName": "MyKeyPair",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
            "KeyId": "key-0123456789EXAMPLE",  
            "Tags": [  
                {  
                    "Key": "Environment",  
                    "Value": "Production"  
                }]  
        }]  
}
```

To tag a public key

Use the [create-tags](#) AWS CLI command. In the following example, the public key is tagged with Key=Cost-Center and Value=CC-123.

```
C:\> aws ec2 create-tags --resources key-0123456789EXAMPLE --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a public key

Use the [delete-tags](#) AWS CLI command. For examples, see [Examples in the AWS CLI Command Reference](#).

PowerShell

To view public key tags

Use the [Get-EC2Tag](#) command.

To describe the tags for a specific public key

Use the [Get-EC2KeyPair](#) command.

To tag a public key

Use the [New-EC2Tag](#) command.

To delete a tag from a public key

Use the [Remove-EC2Tag](#) command.

Describe public keys

You can describe the public keys that are stored in Amazon EC2. You can also retrieve the public key material and identify the public key that was specified at launch.

Topics

- [Describe public keys \(p. 1669\)](#)
- [Retrieve the public key material \(p. 1670\)](#)
- [Identify the public key specified at launch \(p. 1672\)](#)

Describe public keys

You can view the following information about your public keys that are stored in Amazon EC2: public key name, ID, key type, fingerprint, public key material, the date and time (in the UTC time zone) the key was created by Amazon EC2 (if the key was created by a third-party tool, then it's the date and time the key was imported to Amazon EC2), and any tags that are associated with the public key.

You can use the Amazon EC2 console or AWS CLI to view information about your public keys.

Console

To view information about your public keys

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigator, choose **Key Pairs**.
3. You can view the information about each public key in the **Key pairs** table.

Key pairs (23) Info						
	Name	Type	Created	Fingerprint	ID	
<input type="checkbox"/>	ed25519	2021/08/05 10:06 GMT+2	xeDxC7/IVRZ8mFlzsKidfQ2FcfWig4C3...		key-	
<input type="checkbox"/>	rsa	2020/05/13 17:16 GMT+2	ed:71:62:da:a4:d1:f6:47:61:4b:d1:a7:2...		key-	

4. To view a public key's tags, select the check box next to the key, and then choose **Actions**, **Manage tags**.

AWS CLI

To describe a public key

Use the [describe-key-pairs](#) command and specify the `--key-names` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name
```

Example output

```
{  
    "KeyPairs": [  
        {  
            "KeyId": "key-0123456789example",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:b8:ca:9f:f5:f1:6f",  
            "KeyName": "key-pair-name",  
            "KeyType": "rsa",  
            "Tags": [],  
            "CreateTime": "2022-04-28T11:37:26.000Z"  
        }  
    ]  
}
```

Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example
```

To view the public key material in the output, you must specify the `--include-public-key` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the `PublicKey` field contains the public key material.

```
{  
    "KeyPairs": [  
        {  
            "KeyId": "key-0123456789example",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:b8:ca:9f:f5:f1:6f",  
            "KeyName": "key-pair-name",  
            "KeyType": "rsa",  
            "Tags": [],  
            "PublicKey": "ssh-ed25519  
AAAAC3NzaC1lZDI1NTE5AAIAIj7azlDjVHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",  
            "CreateTime": "2022-04-28T11:37:26.000Z"  
        }  
    ]  
}
```

Retrieve the public key material

You can use various methods to get access to the public key material. You can retrieve the public key material from the matching private key on your local computer, or from the instance metadata on the instance that was launched with the public key, or by using the `describe-key-pairs` AWS CLI command.

Use one of the following methods to retrieve the public key material.

From the private key

On your local Windows computer, you can use PuTTYgen to get the public key for your key pair.

Start PuTTYgen and choose **Load**. Select the .ppk or .pem private key file. PuTTYgen displays the public key under **Public key for pasting into OpenSSH authorized_keys file**. You can also view the public key by choosing **Save public key**, specifying a name for the file, saving the file, and then opening the file.

From the instance metadata

You can use Instance Metadata Service Version 2 or Instance Metadata Service Version 1 to retrieve the public key from the instance metadata.

Note

If you change the key pair that you use to connect to the instance, Amazon EC2 does not update the instance metadata to show the new public key. The instance metadata continues to show the public key for the key pair that you specified when you launched the instance.

To retrieve the public key material from the instance metadata

Use one of the following commands from your instance.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

Example output

```
ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQCLksfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706Vhz2ItxCih+PnDSUaw+WNQn/mZphTk/a/gU8jEzo0WbkM4yxyb/wB96xbiFveSFJuOp/d6RJhJOI0iBXr1sLnBItntckiJ7FbtxJMXLvvwJryDUilBMTjYtwB+QhYXUMOzce5Pjz5/i8SeJtjnV3iAoG/cQk+0FzzqaeJAAHco+cY/5WrUBkrHmFJr6HcXkvJdWPkYQS3xqC0+FmUzofz221CBt5IMucxXPkX4rWi+z7wB3RbBQoQzd8v7yeb70z1PnW0yN0qfU0XA246RA8QFYiCNyWI3f05p6KLxEXAMPLE key-pair-name
```

For more information about instance metadata, see [Retrieve instance metadata \(p. 876\)](#).

From describe-key-pairs

To retrieve the public key material from the describe-key-pairs AWS CLI command

Use the [describe-key-pairs](#) command and specify the --key-names parameter to identify the public key. To include the public key material in the output, specify the --include-public-key parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the PublicKey field contains the public key material.

```
{  
    "KeyPairs": [  
        {  
            "KeyId": "key-0123456789example",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
            "KeyName": "key-pair-name",  
            "KeyType": "rsa",  
            "Tags": [],  
            "PublicKey": "ssh-ed25519  
AAAAC3NzaC1lZDI1NTE5AAAAIj7az1DjVHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",  
            "CreateTime": "2022-04-28T11:37:26.000Z"  
        }  
    ]  
}
```

Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example --include-public-key
```

Identify the public key specified at launch

If you specify a public key when you launch an instance, the public key name is recorded by the instance.

To identify the public key that was specified at launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Details** tab, under **Instance details**, the **Key pair assigned at launch** field displays the name of the public key that you specified when you launched the instance.

Note

The value of the **Key pair assigned at launch** field does not change even if you change the public key on the instance, or add public keys.

Delete your public key on Amazon EC2

You can delete public keys that are stored in Amazon EC2. Deleting a public key does not delete the matching private key.

When you delete a public key using the following methods, you're only deleting the public key that you stored in Amazon EC2 when you [created \(p. 1663\)](#) or [imported \(p. 1666\)](#) the key pair. Deleting a public key doesn't remove the public key from any instances to which you've added it, either when you launched the instance or later. It also doesn't delete the private key on your local computer. You can continue to connect to instances that you launched using a public key that you've deleted from Amazon EC2 as long as you still have the private key (.pem) file.

Important

If you're using an Auto Scaling group (for example, in an Elastic Beanstalk environment), ensure that the public key you're deleting is not specified in an associated launch template or launch configuration. If Amazon EC2 Auto Scaling detects an unhealthy instance, it launches a replacement instance. However, the instance launch fails if the public key cannot be found. For more information, see [Launch templates](#) in the *Amazon EC2 Auto Scaling User Guide*.

You can delete a public key on Amazon EC2 using the following methods.

Console

To delete your public key on Amazon EC2

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Select the key pair to delete and choose **Actions, Delete**.
4. In the confirmation field, enter Delete and then choose **Delete**.

AWS CLI

To delete your public key on Amazon EC2

Use the [delete-key-pair](#) AWS CLI command.

PowerShell

To delete your public key on Amazon EC2

Use the [Remove-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

Verify the fingerprint of your key pair

To verify the fingerprint of your key pair, compare the fingerprint displayed on the **Key pairs** page in the Amazon EC2 console, or returned by the [describe-key-pairs](#) command, with the fingerprint that you generate using the private key on your local computer. These fingerprints should match.

When Amazon EC2 calculates a fingerprint, Amazon EC2 might append padding to the fingerprint with = characters. Other tools, such as **ssh-keygen**, might omit this padding.

How the fingerprints are calculated

Amazon EC2 calculates the fingerprints differently using different hash functions depending on whether the key pair was created by Amazon EC2 or imported to Amazon EC2.

The following table lists the hash functions that are used to calculate the fingerprints for RSA key pairs that are created by Amazon EC2 and imported to Amazon EC2.

Hash functions used to calculate fingerprints

Key pair source	RSA key pairs
Created by Amazon EC2	SHA-1
Imported to Amazon EC2	MD5 ¹

¹ If you import a public RSA key to Amazon EC2, the fingerprint is calculated using an MD5 hash function. This is true regardless of how you created the key pair, for example, by using a third-party tool or by generating a new public key from an existing private key created using Amazon EC2.

When using the same key pair in different Regions

If you plan to use the same key pair to connect to instances in different AWS Regions, you must import the public key to all of the Regions in which you'll use it. If you use Amazon EC2 to create the key pair,

you can [Retrieve the public key material \(p. 1670\)](#) so that you can import the public key to the other Regions.

Note

If you create an RSA key pair using Amazon EC2, and then you generate a public key from the Amazon EC2 private key, the imported public keys will have a different fingerprint than the original public key. This is because the fingerprint of the original RSA key created using Amazon EC2 is calculated using a SHA-1 hash function, while the fingerprint of the imported RSA keys is calculated using an MD5 hash function.

Generate a fingerprint from the private key

Use one of the following commands to generate a fingerprint from the private key on your local machine.

If you're using a Windows local machine, you can run the following commands using the Windows Subsystem for Linux (WSL). Install the WSL and a Linux distribution using the instructions in the [Windows 10 Installation Guide](#). The example in the instructions installs the Ubuntu distribution of Linux, but you can install any distribution. You are prompted to restart your computer for the changes to take effect.

- **If you created the key pair using Amazon EC2**

Use the OpenSSL tools to generate a fingerprint as shown in the following examples.

```
openssl pkcs8 -in path_to_private_key -inform PEM -outform DER -topk8 -nocrypt | openssl sha1 -c
```

- **If you imported the public key to Amazon EC2**

You can follow this procedure regardless of how you created the key pair, for example, by using a third-party tool or by generating a new public key from an existing private key created using Amazon EC2

Use the OpenSSL tools to generate the fingerprint as shown in the following example.

```
openssl rsa -in path_to_private_key -pubout -outform DER | openssl md5 -c
```

- **If you created an OpenSSH key pair using OpenSSH 7.8 or later and imported the public key to Amazon EC2**

Use **ssh-keygen** to generate the fingerprint as shown in the following examples.

```
ssh-keygen -ef path_to_private_key -m PEM | openssl rsa -RSAPublicKey_in -outform DER | openssl md5 -c
```

Amazon EC2 security groups for Windows instances

A *security group* acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic. Inbound rules control the incoming traffic to your instance, and outbound rules control the outgoing traffic from your instance. When you launch an instance, you can specify one or more security groups. If you don't specify a security group, Amazon EC2 uses the default security group for the VPC. You can add rules to each security group that allow traffic to or from its associated instances. You can modify the rules for a security group at any time. New and modified rules are automatically applied to all instances

that are associated with the security group. When Amazon EC2 decides whether to allow traffic to reach an instance, it evaluates all of the rules from all of the security groups that are associated with the instance.

When you launch an instance in a VPC, you must specify a security group that's created for that VPC. After you launch an instance, you can change its security groups. Security groups are associated with network interfaces. Changing an instance's security groups changes the security groups associated with the primary network interface (eth0). For more information, see [Change an instance's security group \(p. 1687\)](#). You can also change the security groups associated with any other network interface. For more information, see [Modify network interface attributes \(p. 1307\)](#).

Security is a shared responsibility between AWS and you. For more information, see [Security in Amazon EC2 \(p. 1578\)](#). AWS provides security groups as one of the tools for securing your instances, and you need to configure them to meet your security needs. If you have requirements that aren't fully met by security groups, you can maintain your own firewall on any of your instances in addition to using security groups.

To allow traffic to a Linux instance, see [Amazon EC2 security groups for Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

There is no additional charge for using security groups.

Security group rules

The rules of a security group control the inbound traffic that's allowed to reach the instances that are associated with the security group. The rules also control the outbound traffic that's allowed to leave them.

The following are the characteristics of security group rules:

- By default, security groups contain outbound rules that allow all outbound traffic. You can delete these rules. Note that Amazon EC2 blocks traffic on port 25 by default. For more information, see [Restriction on email sent using port 25 \(p. 2102\)](#).
- Security group rules are always permissive; you can't create rules that deny access.
- Security group rules enable you to filter traffic based on protocols and port numbers.
- Security groups are stateful—if you send a request from your instance, the response traffic for that request is allowed to flow in regardless of inbound security group rules. For VPC security groups, this also means that responses to allowed inbound traffic are allowed to flow out, regardless of outbound rules. For more information, see [Security group connection tracking \(p. 1677\)](#).
- You can add and remove rules at any time. Your changes are automatically applied to the instances that are associated with the security group.

The effect of some rule changes can depend on how the traffic is tracked. For more information, see [Security group connection tracking \(p. 1677\)](#).

- When you associate multiple security groups with an instance, the rules from each security group are effectively aggregated to create one set of rules. Amazon EC2 uses this set of rules to determine whether to allow access.

You can assign multiple security groups to an instance. Therefore, an instance can have hundreds of rules that apply. This might cause problems when you access the instance. We recommend that you condense your rules as much as possible.

Note

Security groups cannot block DNS requests to or from the Route 53 Resolver, sometimes referred to as the 'VPC+2 IP address' (see [What is Amazon Route 53 Resolver?](#) in the *Amazon Route 53 Developer Guide*), or the 'AmazonProvidedDNS' (see [Work with DHCP option sets](#) in the *Amazon Virtual Private Cloud User Guide*). If you wish to filter DNS requests through the Route 53 Resolver, you can enable Route 53 Resolver DNS Firewall (see [Route 53 Resolver DNS Firewall](#) in the *Amazon Route 53 Developer Guide*).

For each rule, you specify the following:

- **Name:** The name for the security group (for example, "my-security-group").
A name can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=;{}!\$*. When the name contains trailing spaces, we trim the spaces when we save the name. For example, if you enter "Test Security Group " for the name, we store it as "Test Security Group".
- **Protocol:** The protocol to allow. The most common protocols are 6 (TCP), 17 (UDP), and 1 (ICMP).
- **Port range:** For TCP, UDP, or a custom protocol, the range of ports to allow. You can specify a single port number (for example, 22), or range of port numbers (for example, 7000-8000).
- **ICMP type and code:** For ICMP, the ICMP type and code. For example, use type 8 for ICMP Echo Request or type 128 for ICMPv6 Echo Request.
- **Source or destination:** The source (inbound rules) or destination (outbound rules) for the traffic to allow. Specify one of the following:

- A single IPv4 address. You must use the /32 prefix length. For example, 203.0.113.1/32.
- A single IPv6 address. You must use the /128 prefix length. For example, 2001:db8:1234:1a00::123/128.
- A range of IPv4 addresses, in CIDR block notation. For example, 203.0.113.0/24.
- A range of IPv6 addresses, in CIDR block notation. For example, 2001:db8:1234:1a00::/64.
- The ID of a prefix list. For example, p1-1234abc1234abc123. For more information, see [Prefix lists](#) in the *Amazon VPC User Guide*.
- The ID of a security group (referred to here as the specified security group). For example, the current security group, a security group from the same VPC, or a security group for a peered VPC. This allows traffic based on the private IP addresses of the resources associated with the specified security group. This does not add rules from the specified security group to the current security group.
- **(Optional) Description:** You can add a description for the rule, which can help you identify it later. A description can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and _-:/()#@[]+=;{}!\$*.

When you create a security group rule, AWS assigns a unique ID to the rule. You can use the ID of a rule when you use the API or CLI to modify or delete the rule.

When you specify a security group as the source or destination for a rule, the rule affects all instances that are associated with the security group. Incoming traffic is allowed based on the private IP addresses of the instances that are associated with the source security group (and not the public IP or Elastic IP addresses). For more information about IP addresses, see [Amazon EC2 instance IP addressing \(p. 1235\)](#). If your security group rule references a deleted security group in the same VPC or in a peer VPC, or if it references a security group in a peer VPC for which the VPC peering connection has been deleted, the rule is marked as stale. For more information, see [Working with Stale Security Group Rules](#) in the *Amazon VPC Peering Guide*.

If there is more than one rule for a specific port, Amazon EC2 applies the most permissive rule. For example, if you have a rule that allows access to TCP port 3389 (RDP) from IP address 203.0.113.1, and another rule that allows access to TCP port 3389 from everyone, everyone has access to TCP port 3389.

When you add, update, or remove rules, the changes are automatically applied to all instances associated with the security group.

Security group connection tracking

Your security groups use connection tracking to track information about traffic to and from the instance. Rules are applied based on the connection state of the traffic to determine if the traffic is allowed or denied. With this approach, security groups are stateful. This means that responses to inbound traffic are allowed to flow out of the instance regardless of outbound security group rules, and vice versa.

As an example, suppose that you initiate a command such as netcat or similar to your instances from your home computer, and your inbound security group rules allow ICMP traffic. Information about the connection (including the port information) is tracked. Response traffic from the instance for the command is not tracked as a new request, but rather as an established connection, and is allowed to flow out of the instance, even if your outbound security group rules restrict outbound ICMP traffic.

For protocols other than TCP, UDP, or ICMP, only the IP address and protocol number is tracked. If your instance sends traffic to another host, and the host sends the same type of traffic to your instance within 600 seconds, the security group for your instance accepts it regardless of inbound security group rules. The security group accepts it because it's regarded as response traffic for the original traffic.

When you change a security group rule, its tracked connections are not immediately interrupted. The security group continues to allow packets until existing connections time out. To ensure that traffic is

immediately interrupted, or that all traffic is subject to firewall rules regardless of the tracking state, you can use a network ACL for your subnet. Network ACLs are stateless and therefore do not automatically allow response traffic. Adding a network ACL that blocks traffic in either direction breaks existing connections. For more information, see [Network ACLs](#) in the *Amazon VPC User Guide*.

Note

Security groups have no effect on DNS traffic to or from the Route 53 Resolver, sometimes referred to as the 'VPC+2 IP address' (see [What is Amazon Route 53 Resolver?](#) in the *Amazon Route 53 Developer Guide*), or the 'AmazonProvidedDNS' (see [Work with DHCP option sets](#) in the *Amazon Virtual Private Cloud User Guide*). If you wish to filter DNS requests through the Route 53 Resolver, you can enable Route 53 Resolver DNS Firewall (see [Route 53 Resolver DNS Firewall](#) in the *Amazon Route 53 Developer Guide*).

Untracked connections

Not all flows of traffic are tracked. If a security group rule permits TCP or UDP flows for all traffic (0.0.0.0/0 or ::/0) and there is a corresponding rule in the other direction that permits all response traffic (0.0.0.0/0 or ::/0) for all ports (0-65535), then that flow of traffic is not tracked, unless it is part of an [automatically tracked connection \(p. 1678\)](#). The response traffic for an untracked flow is allowed based on the inbound or outbound rule that permits the response traffic, not based on tracking information.

An untracked flow of traffic is immediately interrupted if the rule that enables the flow is removed or modified. For example, if you have an open (0.0.0.0/0) outbound rule, and you remove a rule that allows all (0.0.0.0/0) inbound SSH (TCP port 22) traffic to the instance (or modify it such that the connection would no longer be permitted), your existing SSH connections to the instance are immediately dropped. The connection was not previously being tracked, so the change will break the connection. On the other hand, if you have a narrower inbound rule that initially allows an SSH connection (meaning that the connection was tracked), but change that rule to no longer allow new connections from the address of the current SSH client, the existing SSH connection is not interrupted because it is tracked.

Automatically tracked connections

Connections made through the following are automatically tracked, even if the security group configuration does not otherwise require tracking. These connections must be tracked to ensure symmetric routing, as there could be multiple valid reply paths.

- Egress-only internet gateways
- Gateway Load Balancers
- Global Accelerator accelerators
- NAT gateways
- Network Firewall firewall endpoints
- Network Load Balancers
- AWS PrivateLink (interface VPC endpoints)
- Transit gateway attachments

Throttling

Amazon EC2 defines the maximum number of connections that can be tracked per instance. After the maximum is reached, any packets that are sent or received are dropped because a new connection cannot be established. When this happens, applications that send and receive packets cannot communicate properly. Use the `conntrack_allowance_available` network performance metric to determine the number of tracked connections still available for that instance type.

To determine whether packets were dropped because the network traffic for your instance exceeded the maximum number of connections that can be tracked, use the `conntrack_allowance_exceeded`

network performance metric. For more information, see [Monitor network performance for your EC2 instance \(p. 1349\)](#).

With Elastic Load Balancing, if you exceed the maximum number of connections that can be tracked per instance, we recommend that you scale either the number of instances registered with the load balancer or the size of the instances registered with the load balancer.

Example

In the following example, the security group has inbound rules that allow TCP and ICMP traffic, and outbound rules that allow all outbound traffic.

Inbound

Protocol type	Port number	Source
TCP	22 (SSH)	203.0.113.1/32
TCP	80 (HTTP)	0.0.0.0/0
TCP	80 (HTTP)	::/0
ICMP	All	0.0.0.0/0

Outbound

Protocol type	Port number	Destination
All	All	0.0.0.0/0
All	All	::/0

With a direct network connection to the instance or network interface, the tracking behavior is as follows:

- Inbound and outbound TCP traffic on port 22 (SSH) is tracked, because the inbound rule allows traffic from 203.0.113.1/32 only, and not all IP addresses (0.0.0.0/0).
- Inbound and outbound TCP traffic on port 80 (HTTP) is not tracked, because the inbound and outbound rules allow traffic from all IP addresses.
- ICMP traffic is always tracked.

If you remove the outbound rule for IPv4 traffic, all inbound and outbound IPv4 traffic is tracked, including traffic on port 80 (HTTP). The same applies for IPv6 traffic if you remove the outbound rule for IPv6 traffic.

Default and custom security groups

Your AWS account automatically has a default security group for the default VPC in each Region. If you don't specify a security group when you launch an instance, the instance is automatically associated with the default security group for the VPC. If you don't want your instances to use the default security group, you can create your own custom security groups and specify them when you launch your instances.

Contents

- [Default security groups \(p. 1680\)](#)
- [Custom security groups \(p. 1680\)](#)

Default security groups

Each VPC comes with a default security group. We recommend that you create security groups for specific instances or groups of instances instead of using the default security group. However, if you don't specify a security group when you launch an instance, we associate the instance with the default security group for the VPC.

The name of a default security group is "default". The following are the default rules for a default security group.

Inbound

Source	Protocol	Port range	Description
<code>sg-1234567890abcdef0</code>	All	All	Allows inbound traffic from all resources that are assigned to this security group. The source is the ID of this security group.

Outbound

Destination	Protocol	Port range	Description
0.0.0.0/0	All	All	Allows all outbound IPv4 traffic.
::/0	All	All	Allows all outbound IPv6 traffic. This rule is added only if your VPC has an associated IPv6 CIDR block.

Default security group basics

- You can change the rules for a default security group.
- You can't delete a default security group. If you try to delete a default security group, we return the following error code: `Client.CannotDelete`.

Custom security groups

You can create multiple security groups to reflect the different roles that your instances play; for example, web servers or database servers.

When you create a security group, you must provide it with a name and a description. Security group names and descriptions can be up to 255 characters in length, and are limited to the following characters:

a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=&;{}!\$*

A security group name cannot start with the following: `sg-`. A security group name must be unique for the VPC.

The following are the default rules for a security group that you create:

- Allows no inbound traffic
- Allows all outbound traffic

After you've created a security group, you can change its inbound rules to reflect the type of inbound traffic that you want to reach the associated instances. You can also change its outbound rules.

For more information about the rules you can add to a security group, see [Security group rules for different use cases \(p. 1687\)](#).

Work with security groups

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group. For more information, see [Assign a security group to an instance \(p. 1687\)](#).

After you launch an instance, you can change its security groups. For more information, see [Change an instance's security group \(p. 1687\)](#).

You can create, view, update, and delete security groups and security group rules using the Amazon EC2 console and the command line tools.

Tasks

- [Create a security group \(p. 1681\)](#)
- [Copy a security group \(p. 1682\)](#)
- [View your security groups \(p. 1682\)](#)
- [Add rules to a security group \(p. 1683\)](#)
- [Update security group rules \(p. 1684\)](#)
- [Delete rules from a security group \(p. 1685\)](#)
- [Delete a security group \(p. 1686\)](#)
- [Assign a security group to an instance \(p. 1687\)](#)
- [Change an instance's security group \(p. 1687\)](#)

Create a security group

Although you can use the default security group for your instances, you might want to create your own groups to reflect the different roles that instances play in your system.

By default, new security groups start with only an outbound rule that allows all traffic to leave the instances. You must add rules to enable any inbound traffic or to restrict the outbound traffic.

A security group can be used only in the VPC for which it is created.

Console

To create a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Choose **Create security group**.
4. In the **Basic details** section, do the following.
 - a. Enter a descriptive name and brief description for the security group. They can't be edited after the security group is created. The name and description can be up to 255 characters long. The valid characters are a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=&;{}!\$*.
 - b. For **VPC**, choose the VPC.
5. You can add security group rules now, or you can add them later. For more information, see [Add rules to a security group \(p. 1683\)](#).
6. You can add tags now, or you can add them later. To add a tag, choose **Add new tag** and enter the tag key and value.
7. Choose **Create security group**.

Command line

To create a security group

Use one of the following commands:

- [create-security-group](#) (AWS CLI)
- [New-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Copy a security group

You can create a new security group by creating a copy of an existing one. When you copy a security group, the copy is created with the same inbound and outbound rules as the original security group. If the original security group is in a VPC, the copy is created in the same VPC unless you specify a different one.

The copy receives a new unique security group ID and you must give it a name. You can also add a description.

You can't copy a security group from one Region to another Region.

You can create a copy of a security group using the Amazon EC2 console.

To copy a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to copy and choose **Actions, Copy to new security group**.
4. Specify a name and optional description, and change the VPC and security group rules if needed.
5. Choose **Create**.

View your security groups

You can view information about your security groups using one of the following methods.

Console

To view your security groups

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Your security groups are listed. To view the details for a specific security group, including its inbound and outbound rules, choose its ID in the **Security group ID** column.

Command line

To view your security groups

Use one of the following commands.

- [describe-security-groups](#) (AWS CLI)
- [describe-security-group-rules](#) (AWS CLI)
- [Get-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Amazon EC2 Global View

You can use Amazon EC2 Global View to view your security groups across all Regions for which your AWS account is enabled. For more information, see [List and filter resources across Regions using Amazon EC2 Global View \(p. 2083\)](#).

Add rules to a security group

When you add a rule to a security group, the new rule is automatically applied to any instances that are associated with the security group. There might be a short delay before the rule is applied. For more information, see [Security group rules for different use cases \(p. 1687\)](#) and [Security group rules \(p. 1676\)](#).

Console

To add an inbound rule to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group, and choose **Actions, Edit inbound rules**.
4. For each rule, choose **Add rule** and do the following.
 - a. For **Type**, choose the type of protocol to allow.
 - For custom TCP or UDP, you must enter the port range to allow.
 - For custom ICMP, you must choose the ICMP type from **Protocol**, and, if applicable, the code from **Port range**. For example, to allow ping commands, choose **Echo Request** from **Protocol**.
 - For any other type, the protocol and port range are configured for you.
 - b. For **Source**, do one of the following to allow traffic.
 - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list.
 - Choose **Anywhere** to allow all traffic for the specified protocol to reach your instance. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the source. If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.
 - c. For **Description**, optionally specify a brief description for the rule.
5. Choose **Preview changes, Save rules**.

Warning

If you choose **Anywhere**, you enable all IPv4 and IPv6 addresses to access your instance the specified protocol. If you are adding rules for ports 22 (SSH) or 3389 (RDP), you should authorize only a specific IP address or range of addresses to access your instance.

- Choose **My IP** to allow inbound traffic from only your local computer's public IPv4 address.

- c. For **Description**, optionally specify a brief description for the rule.

5. Choose **Preview changes, Save rules**.

To add an outbound rule to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group, and choose **Actions, Edit outbound rules**.
4. For each rule, choose **Add rule** and do the following.

- a. For **Type**, choose the type of protocol to allow.
 - For custom TCP or UDP, you must enter the port range to allow.
 - For custom ICMP, you must choose the ICMP type from **Protocol**, and, if applicable, the code from **Port range**.
 - For any other type, the protocol and port range are configured automatically.
 - b. For **Destination**, do one of the following.
 - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list for which to allow outbound traffic.
 - Choose **Anywhere** to allow outbound traffic to all IP addresses. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the destination.
- If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.
- c. (Optional) For **Description**, specify a brief description for the rule.
5. Choose **Preview changes, Confirm**.

Command line

To add rules to a security group

Use one of the following commands.

- [authorize-security-group-ingress](#) (AWS CLI)
- [Grant-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

To add one or more egress rules to a security group

Use one of the following commands.

- [authorize-security-group-egress](#) (AWS CLI)
- [Grant-EC2SecurityGroupEgress](#) (AWS Tools for Windows PowerShell)

Update security group rules

You can update a security group rule using one of the following methods. The updated rule is automatically applied to any instances that are associated with the security group.

Console

When you modify the protocol, port range, or source or destination of an existing security group rule using the console, the console deletes the existing rule and adds a new one for you.

To update a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group.
4. Choose **Actions, Edit inbound rules** to update a rule for inbound traffic or **Actions, Edit outbound rules** to update a rule for outbound traffic.

5. Update the rule as required.
6. Choose **Preview changes, Confirm**.

To tag a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group.
4. On the **Inbound rules** or **Outbound rules** tab, select the check box for the rule and then choose **Manage tags**.
5. The **Manage tags** page displays any tags that are assigned to the rule. To add a tag, choose **Add tag** and enter the tag key and value. To delete a tag, choose **Remove** next to the tag that you want to delete.
6. Choose **Save changes**.

Command line

You cannot modify the protocol, port range, or source or destination of an existing rule using the Amazon EC2 API or a command line tools. Instead, you must delete the existing rule and add a new rule. You can, however, update the description of an existing rule.

To update a rule

Use one the following command.

- [modify-security-group-rules](#) (AWS CLI)

To update the description for an existing inbound rule

Use one of the following commands.

- [update-security-group-rule-descriptions-ingress](#) (AWS CLI)
- [Update-EC2SecurityGroupRuleIngressDescription](#) (AWS Tools for Windows PowerShell)

To update the description for an existing outbound rule

Use one of the following commands.

- [update-security-group-rule-descriptions-egress](#) (AWS CLI)
- [Update-EC2SecurityGroupRuleEgressDescription](#) (AWS Tools for Windows PowerShell)

To tag a security group rule

Use one of the following commands.

- [create-tags](#) (AWS CLI)
- [New-EC2Tag](#) (AWS Tools for Windows PowerShell)

Delete rules from a security group

When you delete a rule from a security group, the change is automatically applied to any instances associated with the security group.

You can delete rules from a security group using one of the following methods.

Console

To delete a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to update, choose **Actions**, and then choose **Edit inbound rules** to remove an inbound rule or **Edit outbound rules** to remove an outbound rule.
4. Choose the **Delete** button to the right of the rule to delete.
5. Choose **Save rules**. Alternatively, choose **Preview changes**, review your changes, and choose **Confirm**.

Command line

To remove one or more ingress rules from a security group

Use one of the following commands.

- [revoke-security-group-ingress](#) (AWS CLI)
- [Revoke-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

To remove one or more egress rules from a security group

Use one of the following commands.

- [revoke-security-group-egress](#) (AWS CLI)
- [Revoke-EC2SecurityGroupEgress](#) (AWS Tools for Windows PowerShell)

Delete a security group

You can't delete a security group that is associated with an instance. You can't delete the default security group. You can't delete a security group that is referenced by a rule in another security group in the same VPC. If your security group is referenced by one of its own rules, you must delete the rule before you can delete the security group.

Console

To delete a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group and choose **Actions**, **Delete security groups**.
4. When prompted for confirmation, choose **Delete**.

Command line

To delete a security group

Use one of the following commands.

- [delete-security-group](#) (AWS CLI)
- [Remove-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Assign a security group to an instance

You can assign one or more security groups to an instance when you launch the instance. You can also specify one or more security groups in a launch template. The security groups are assigned to all instances that are launched using the launch template.

- To assign a security group to an instance when you launch the instance, see [Network settings \(p. 556\)](#) of [Launch an instance using defined parameters \(p. 554\)](#) (new console) or [Step 6: Configure Security Group \(p. 566\)](#) (old console).
- To specify a security group in a launch template, see [Network settings \(p. 572\)](#) of [Create a new launch template using parameters you define \(p. 570\)](#).

Change an instance's security group

After you launch an instance, you can change its security groups by adding or removing security groups.

Requirements

- The instance must be in the running or stopped state.
- A security group is specific to a VPC. You can assign a security group to one or more instances launched in the VPC for which you created the security group.

Console

To change the security groups for an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and then choose **Actions, Security, Change security groups**.
4. For **Associated security groups**, select a security group from the list and choose **Add security group**.
To remove an already associated security group, choose **Remove** for that security group.
5. Choose **Save**.

Command line

To change the security groups for an instance

Use one of the following commands.

- [modify-instance-attribute](#) (AWS CLI)
- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

Security group rules for different use cases

You can create a security group and add rules that reflect the role of the instance that's associated with the security group. For example, an instance that's configured as a web server needs security group rules that allow inbound HTTP and HTTPS access. Likewise, a database instance needs rules that allow access for the type of database, such as access over port 3306 for MySQL.

The following are examples of the kinds of rules that you can add to security groups for specific kinds of access.

Examples

- [Web server rules \(p. 1688\)](#)
- [Database server rules \(p. 1688\)](#)
- [Rules to connect to instances from your computer \(p. 1689\)](#)
- [Rules to connect to instances from an instance with the same security group \(p. 1690\)](#)
- [Rules for ping/ICMP \(p. 1690\)](#)
- [DNS server rules \(p. 1690\)](#)
- [Amazon EFS rules \(p. 1691\)](#)
- [Elastic Load Balancing rules \(p. 1691\)](#)
- [VPC peering rules \(p. 1691\)](#)

Web server rules

The following inbound rules allow HTTP and HTTPS access from any IP address. If your VPC is enabled for IPv6, you can add rules to control inbound HTTP and HTTPS traffic from IPv6 addresses.

Protocol type	Protocol number	Port	Source IP	Notes
TCP	6	80 (HTTP)	0.0.0.0/0	Allows inbound HTTP access from any IPv4 address
TCP	6	443 (HTTPS)	0.0.0.0/0	Allows inbound HTTPS access from any IPv4 address
TCP	6	80 (HTTP)	::/0	Allows inbound HTTP access from any IPv6 address
TCP	6	443 (HTTPS)	::/0	Allows inbound HTTPS access from any IPv6 address

Database server rules

The following inbound rules are examples of rules you might add for database access, depending on what type of database you're running on your instance. For more information about Amazon RDS instances, see the [Amazon RDS User Guide](#).

For the source IP, specify one of the following:

- A specific IP address or range of IP addresses (in CIDR block notation) in your local network
- A security group ID for a group of instances that access the database

Protocol type	Protocol number	Port	Notes
TCP	6	1433 (MS SQL)	The default port to access a Microsoft SQL Server database, for example, on an Amazon RDS instance
TCP	6	3306 (MySQL/Aurora)	The default port to access a MySQL or Aurora database, for example, on an Amazon RDS instance

Protocol type	Protocol number	Port	Notes
TCP	6	5439 (Redshift)	The default port to access an Amazon Redshift cluster database.
TCP	6	5432 (PostgreSQL)	The default port to access a PostgreSQL database, for example, on an Amazon RDS instance
TCP	6	1521 (Oracle)	The default port to access an Oracle database, for example, on an Amazon RDS instance

You can optionally restrict outbound traffic from your database servers. For example, you might want to allow access to the internet for software updates, but restrict all other kinds of traffic. You must first remove the default outbound rule that allows all outbound traffic.

Protocol type	Protocol number	Port	Destination IP	Notes
TCP	6	80 (HTTP)	0.0.0.0/0	Allows outbound HTTP access to any IPv4 address
TCP	6	443 (HTTPS)	0.0.0.0/0	Allows outbound HTTPS access to any IPv4 address
TCP	6	80 (HTTP)	::/0	(IPv6-enabled VPC only) Allows outbound HTTP access to any IPv6 address
TCP	6	443 (HTTPS)	::/0	(IPv6-enabled VPC only) Allows outbound HTTPS access to any IPv6 address

Rules to connect to instances from your computer

To connect to your instance, your security group must have inbound rules that allow SSH access (for Linux instances) or RDP access (for Windows instances).

Protocol type	Protocol number	Port	Source IP
TCP	6	22 (SSH)	The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.
TCP	6	3389 (RDP)	The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.

Rules to connect to instances from an instance with the same security group

To allow instances that are associated with the same security group to communicate with each other, you must explicitly add rules for this.

Note

If you configure routes to forward the traffic between two instances in different subnets through a middlebox appliance, you must ensure that the security groups for both instances allow traffic to flow between the instances. The security group for each instance must reference the private IP address of the other instance, or the CIDR range of the subnet that contains the other instance, as the source. If you reference the security group of the other instance as the source, this does not allow traffic to flow between the instances.

The following table describes the inbound rule for a security group that enables associated instances to communicate with each other. The rule allows all types of traffic.

Protocol type	Protocol number	Ports	Source IP
-1 (All)	-1 (All)	-1 (All)	The ID of the security group, or the CIDR range of the subnet that contains the other instance (see note).

Rules for ping/ICMP

The **ping** command is a type of ICMP traffic. To ping your instance, you must add the following inbound ICMP rule.

Protocol type	Protocol number	ICMP type	ICMP code	Source IP
ICMP	1	8 (Echo Request)	N/A	The public IPv4 address of your computer, or a range of IPv4 addresses in your local network.

To use the **ping6** command to ping the IPv6 address for your instance, you must add the following inbound ICMPv6 rule.

Protocol type	Protocol number	ICMP type	ICMP code	Source IP
ICMPv6	58	128 (Echo Request)	0	The IPv6 address of your computer, or a range of IPv6 addresses in your local network.

DNS server rules

If you've set up your EC2 instance as a DNS server, you must ensure that TCP and UDP traffic can reach your DNS server over port 53.

For the source IP, specify one of the following:

- An IP address or range of IP addresses (in CIDR block notation) in a network
- The ID of a security group for the set of instances in your network that require access to the DNS server

Protocol type	Protocol number	Port
TCP	6	53
UDP	17	53

Amazon EFS rules

If you're using an Amazon EFS file system with your Amazon EC2 instances, the security group that you associate with your Amazon EFS mount targets must allow traffic over the NFS protocol.

Protocol type	Protocol number	Ports	Source IP	Notes
TCP	6	2049 (NFS)	The ID of the security group	Allows inbound NFS access from resources (including the mount target) associated with this security group

To mount an Amazon EFS file system on your Amazon EC2 instance, you must connect to your instance. Therefore, the security group associated with your instance must have rules that allow inbound SSH from your local computer or local network.

Protocol type	Protocol number	Ports	Source IP	Notes
TCP	6	22 (SSH)	The IP address range of your local computer, or the range of IP addresses (in CIDR block notation) for your network.	Allows inbound SSH access from your local computer.

Elastic Load Balancing rules

If you're using a load balancer, the security group associated with your load balancer must have rules that allow communication with your instances or targets. For more information, see [Configure security groups for your Classic Load Balancer](#) in the *User Guide for Classic Load Balancers*, and [Security groups for your Application Load Balancer](#) in the *User Guide for Application Load Balancers*.

VPC peering rules

You can update the inbound or outbound rules for your VPC security groups to reference security groups in the peered VPC. Doing so allows traffic to flow to and from instances that are associated with the referenced security group in the peered VPC. For more information about how to configure security groups for VPC peering, see [Updating your security groups to reference peer VPC groups](#).

Access Amazon EC2 using an interface VPC endpoint

You can improve the security posture of your VPC by creating a private connection between your VPC and Amazon EC2. You can access Amazon EC2 as if it were in your VPC, without the use of an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. Instances in your VPC don't need public IP addresses to access Amazon EC2.

For more information, see [Access AWS services through AWS PrivateLink](#) in the *AWS PrivateLink Guide*.

Contents

- [Create an interface VPC endpoint \(p. 1692\)](#)
- [Create an endpoint policy \(p. 1692\)](#)

Create an interface VPC endpoint

Create an interface endpoint for Amazon EC2 using the following service name:

- **com.amazonaws.*region*.ec2** — Creates an endpoint for the Amazon EC2 API actions.

For more information, see [Access an AWS service using an interface VPC endpoint](#) in the *AWS PrivateLink Guide*.

Create an endpoint policy

An endpoint policy is an IAM resource that you can attach to your interface endpoint. The default endpoint policy allows full access to the Amazon EC2 API through the interface endpoint. To control the access allowed to the Amazon EC2 API from your VPC, attach a custom endpoint policy to the interface endpoint.

An endpoint policy specifies the following information:

- The principals that can perform actions.
- The actions that can be performed.
- The resource on which the actions can be performed.

Important

When a non-default policy is applied to an interface VPC endpoint for Amazon EC2, certain failed API requests, such as those failing from RequestLimitExceeded, might not be logged to AWS CloudTrail or Amazon CloudWatch.

For more information, see [Control access to services using endpoint policies](#) in the *AWS PrivateLink Guide*.

The following example shows a VPC endpoint policy that denies permission to create unencrypted volumes or to launch instances with unencrypted volumes. The example policy also grants permission to perform all other Amazon EC2 actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [
```

```
{  
    "Action": "ec2:*",  
    "Effect": "Allow",  
    "Resource": "*",  
    "Principal": "*"  
},  
{  
    "Action": [  
        "ec2:CreateVolume"  
    ],  
    "Effect": "Deny",  
    "Resource": "*",  
    "Principal": "*",  
    "Condition": {  
        "Bool": {  
            "ec2:Encrypted": "false"  
        }  
    }  
},  
{  
    "Action": [  
        "ec2:RunInstances"  
    ],  
    "Effect": "Deny",  
    "Resource": "*",  
    "Principal": "*",  
    "Condition": {  
        "Bool": {  
            "ec2:Encrypted": "false"  
        }  
    }  
}  
}]  
}
```

Configuration management in Amazon EC2

Amazon Machine Images (AMIs) provide an initial configuration for an Amazon EC2 instance, which includes the Windows OS and optional customer-specific customizations, such as applications and security controls. Create an AMI catalog containing customized security configuration baselines to ensure all Windows instances are launched with standard security controls. Security baselines can be baked into an AMI, bootstrapped dynamically when an EC2 instance is launched, or packaged as a product for uniform distribution through AWS Service Catalog portfolios. For more information on securing an AMI, see [Best Practices for Building an AMI](#).

Each Amazon EC2 instance should adhere to organizational security standards. Do not install any Windows roles and features that are not required, and do install software to protect against malicious code (antivirus, antimalware, exploit mitigation), monitor host-integrity, and perform intrusion detection. Configure security software to monitor and maintain OS security settings, protect the integrity of critical OS files, and alert on deviations from the security baseline. Consider implementing recommended security configuration benchmarks published by Microsoft, the Center for Internet Security (CIS), or the National Institute of Standards and Technology (NIST). Consider using other Microsoft tools for particular application servers, such as the [Best Practice Analyzer for SQL Server](#).

AWS customers can also run Amazon Inspector assessments to improve the security and compliance of applications deployed on Amazon EC2 instances. Amazon Inspector automatically assesses applications for vulnerabilities or deviations from best practices and includes a knowledge base of hundreds of rules mapped to common security compliance standards (for example, PCI DSS) and vulnerability definitions. Examples of built-in rules include checking if remote root login is enabled, or if vulnerable software versions are installed. These rules are regularly updated by AWS security researchers.

Update management in Amazon EC2

We recommend that you regularly patch, update, and secure the operating system and applications on your EC2 instances. You can use [AWS Systems Manager Patch Manager](#) to automate the process of installing security-related updates for both the operating system and applications.

For EC2 instances in an Auto Scaling group, you can use the [AWS-PatchAsgInstance](#) runbook to help avoid instances that are undergoing patching from being replaced. Alternatively, you can use any automatic update services or recommended processes for installing updates that are provided by the application vendor.

You should configure Windows Update on your Amazon EC2 instances running Windows Server. By default, you will not receive Windows updates on AMIs provided by AWS. For more information, see [Best practices for Windows on Amazon EC2 \(p. 23\)](#).

For a list of the latest Amazon EC2 AMIs running Windows Server, see [Details About AWS Windows AMI Versions](#).

Change management in Amazon EC2

After initial security baselines are applied to Amazon EC2 instances at launch, control ongoing Amazon EC2 changes to maintain the security of your virtual machines. Establish a change management process to authorize and incorporate changes to AWS resources (such as security groups, route tables, and network ACLs) as well as to OS and application configurations (such as Windows or application patching, software upgrades, or configuration file updates).

AWS provides several tools to help manage changes to AWS resources, including AWS CloudTrail, AWS Config, AWS CloudFormation, and AWS Elastic Beanstalk, AWS OpsWorks, and management packs for Systems Center Operations Manager and System Center Virtual Machine Manager. Note that Microsoft releases Windows patches every Tuesday (sometimes even daily) and AWS updates all Windows AMIs managed by AWS within five days after Microsoft releases a patch. Therefore it is important to continually patch all baseline AMIs, update AWS CloudFormation templates and Auto Scaling group configurations with the latest AMI IDs, and implement tools to automate running instance patch management.

Microsoft provides several options for managing Windows OS and application changes. SCCM, for example, provides full lifecycle coverage of environment modifications. Select tools that address business requirements and control how changes will affect application SLAs, capacity, security, and disaster recovery procedures. Avoid manual changes and instead leverage automated configuration management software or command line tools such as the EC2 Run Command or Windows PowerShell to implement scripted, repeatable change processes. To assist with this requirement, use bastion hosts with enhanced logging for all interactions with your Windows instances to ensure that all events and tasks are automatically recorded.

Compliance validation for Amazon EC2

To learn whether an AWS service is within the scope of specific compliance programs, see [AWS services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- [Architecting for HIPAA Security and Compliance on Amazon Web Services](#) – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

Note

Not all AWS services are HIPAA eligible. For more information, see the [HIPAA Eligible Services Reference](#).

- [AWS Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [Evaluating Resources with Rules](#) in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see [Security Hub controls reference](#).
- [AWS Audit Manager](#) – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

Amazon EC2 provides Amazon Machine Images (AMI) for Windows Server to help you meet the compliance standards of the Security Technical Implementation Guide (STIG). These AMIs are pre-configured with a number of STIG standards to help you get started with your deployments while meeting STIG compliance standards. For more information, see [STIG Hardened Amazon EC2 Windows Server AMIs \(p. 62\)](#).

Audit and accountability in Amazon EC2

AWS CloudTrail, AWS Config, and AWS Config Rules provide audit and change tracking features for auditing AWS resource changes. Configure Windows event logs to send local log files to a centralized log management system to preserve log data for security and operational behavior analysis. Microsoft System Center Operations Manager (SCOM) aggregates information about Microsoft applications deployed to Windows instances and applies preconfigured and custom rulesets based on application roles and services. System Center Management Packs build on SCOM to provide application-specific monitoring and configuration guidance. These [Management Packs](#) support Windows Server Active Directory, SharePoint Server 2013, Exchange Server 2013, Lync Server 2013, SQL Server 2014, and many more servers and technologies. The AWS Management Pack for Microsoft System Center Operations Manager (SCOM) and the Systems Manager for Microsoft System Center Virtual Machine Manager (SCVMM) integrate with Microsoft Systems Center to help you monitor and manage your on-premises and AWS environments together.

In addition to Microsoft systems management tools, customers can use Amazon CloudWatch to monitor instance CPU utilization, disk performance, network I/O, and perform host and instance status checks. The EC2Config and EC2Launch services provide access to additional, advanced features for Windows instances. For example, they can export Windows system, security, application, and Internet Information Services (IIS) logs to CloudWatch Logs which can then be integrated with Amazon CloudWatch metrics and alarms. Customers can also create scripts that export Windows performance counters to Amazon CloudWatch custom metrics.

NitroTPM

Nitro Trusted Platform Module (NitroTPM) is a virtual device that is provided by the [AWS Nitro System](#) and conforms to the [TPM 2.0 specification](#). It securely stores artifacts (such as passwords, certificates, or encryption keys) that are used to authenticate the instance. NitroTPM can generate keys and use them for cryptographic functions (such as hashing, signing, encryption, and decryption).

NitroTPM provides *measured boot*, a process where the bootloader and operating system create cryptographic hashes of every boot binary and combine them with the previous values in NitroTPM internal Platform Configuration Registers (PCRs). With measured boot, you can obtain signed PCR values from NitroTPM and use them to prove to remote entities the integrity of the instance's boot software. This is known as remote *attestation*.

With NitroTPM, keys and secrets can be tagged with a specific PCR value so that they can never be accessed if the value of the PCR, and thus the instance integrity, changes. This special form of conditional access is referred to as *sealing and unsealing*. Operating system technologies, like [BitLocker](#), can use NitroTPM to seal a drive decryption key so that the drive can only be decrypted when the operating system has booted correctly and is in a known good state.

To use NitroTPM, you must select an [Amazon Machine Image \(p. 28\)](#) (AMI) that has been configured for NitroTPM support, and then use the AMI to launch a [Nitro-based instance \(p. 218\)](#). You can select one of Amazon's prebuilt AMIs or create one yourself.

Costs

There is no additional cost for using NitroTPM. You pay only for the underlying resources that you use.

Topics

- [Considerations \(p. 1696\)](#)
- [Prerequisites for launching Windows instances \(p. 1697\)](#)
- [Verify whether an AMI is enabled for NitroTPM \(p. 1697\)](#)
- [Enable or stop using NitroTPM on an instance \(p. 1698\)](#)

Considerations

The following considerations apply when using NitroTPM:

- BitLocker volumes that are encrypted with NitroTPM-based keys can only be used on the original instance.
- The NitroTPM state is not included in [Amazon EBS snapshots \(p. 1757\)](#).
- The NitroTPM state is not included in [VM Import/Export](#) images.
- NitroTPM support is enabled by specifying a value of v2.0 for the tpm-support parameter when creating an AMI. After you launch an instance with the AMI, you can't modify the attributes on the instance. Instances with NitroTPM do not support the [ModifyInstanceAttribute](#) API.
- You can only create an AMI with NitroTPM configured by using the [RegisterImage](#) API by using the AWS CLI and not with the Amazon EC2 console.
- NitroTPM is not supported on Outposts.
- NitroTPM is not supported in Local Zones or Wavelength Zones.

Prerequisites for launching Windows instances

To launch a Windows instance with NitroTPM enabled, the following prerequisites must be in place. For the prerequisites for launching a Linux instance, see [Prerequisites for launching Linux instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

AMI

Requires an AMI with NitroTPM enabled.

The following Windows AMIs are preconfigured to enable NitroTPM and UEFI Secure Boot with Microsoft keys:

- TPM-Windows_Server-2022-English-Core-Base
- TPM-Windows_Server-2022-English-Full-Base
- TPM-Windows_Server-2022-English-Full-SQL_2022_Enterprise
- TPM-Windows_Server-2022-English-Full-SQL_2022_Standard
- TPM-Windows_Server-2019-English-Core-Base
- TPM-Windows_Server-2019-English-Full-Base
- TPM-Windows_Server-2019-English-Full-SQL_2019_Enterprise
- TPM-Windows_Server-2019-English-Full-SQL_2019_Standard
- TPM-Windows_Server-2016-English-Core-Base
- TPM-Windows_Server-2016-English-Full-Base

Currently, we do not support importing Windows with NitroTPM by using the [import-image](#) command.

Operating system

The AMI must include an operating system with a TPM 2.0 Command Response Buffer (CRB) driver. Most current operating systems, such as TPM-Windows_Server-2022-English-Full-Base, contain a TPM 2.0 CRB driver.

Instance type

Supported virtualized instance types:

- **General purpose:** M5, M5a, M5ad, M5d, M5dn, M5n, M5zn, M6a, M6i, M6id, M6idn, M6in, T3, and T3a
- **Compute optimized:** C5, C5a, C5ad, C5d, C5n, C6a, C6i, C6id, and C6in
- **Memory optimized:** Hpc6id, R5, R5a, R5ad, R5b, R5d, R5dn, R5n, R6a, R6i, R6idn, R6in, R6id, and z1d
- **Storage optimized:** D3, D3en, I3en, and I4i
- **Accelerated computing:** G4dn, and G5

Not supported: Graviton-based instances, Xen instances, Mac instances, and bare metal instances

UEFI boot mode

NitroTPM requires that an instance runs in UEFI boot mode, which requires that the AMI must be configured for UEFI boot mode. For more information, see [UEFI Secure Boot \(p. 38\)](#).

Verify whether an AMI is enabled for NitroTPM

You can use either `describe-images` or `describe-image-attributes` to verify whether an AMI is enabled for NitroTPM.

To verify whether an AMI is enabled for NitroTPM using `describe-images`

Use the [describe-images](#) command and specify the AMI ID.

```
aws ec2 describe-images --image-ids ami-0123456789example
```

If NitroTPM is enabled for the AMI, "TpmSupport": "v2.0" appears in the output.

```
{  
    "Images": [  
        {  
            ...  
            "BootMode": "uefi",  
            ...  
            "TpmSupport": "v2.0"  
        }  
    ]  
}
```

To verify whether an AMI is enabled for NitroTPM using `describe-image-attribute`

Use the [describe-image-attribute](#) command and specify the attribute parameter with the `tpmSupport` value.

Note

You must be the AMI owner to call `describe-image-attribute`.

```
aws ec2 describe-image-attribute \  
    --region us-east-1 \  
    --image-id ami-0123456789example \  
    --attribute tpmSupport
```

If NitroTPM is enabled for the AMI, the value for `TpmSupport` is "v2.0". Note that `describe-image-attribute` only returns the attributes that are specified in the request.

```
{  
    "ImageId": "ami-0123456789example",  
    "TpmSupport": {  
        "Value": "v2.0"  
    }  
}
```

Enable or stop using NitroTPM on an instance

When you launch an instance from an AMI that has NitroTPM support enabled, the instance launches with NitroTPM enabled. You can configure the instance to stop using NitroTPM. You can verify whether an instance is enabled for NitroTPM.

Topics

- [Launch an instance with NitroTPM enabled \(p. 1698\)](#)
- [Stop using NitroTPM on an instance \(p. 1699\)](#)
- [Verify whether NitroTPM is accessible inside the instance \(p. 1699\)](#)

Launch an instance with NitroTPM enabled

When you launch an instance with the [prerequisites \(p. 1697\)](#), NitroTPM is automatically enabled on the instance. You can only enable NitroTPM on an instance at launch. For information about launching an instance, see [Launch your instance \(p. 551\)](#).

Stop using NitroTPM on an instance

After launching an instance with NitroTPM enabled, you can't disable NitroTPM for the instance. However, you can configure the operating system to stop using NitroTPM by disabling the TPM 2.0 device driver on the instance by using the following tools:

- For Windows, use the TPM management console, tpm.msc.

For more information about disabling the device driver, see the documentation for your operating system.

Verify whether NitroTPM is accessible inside the instance

To verify whether an instance is enabled for NitroTPM support using the AWS CLI

Use the [describe-instances](#) AWS CLI command and specify the instance ID. Currently, the Amazon EC2 console does not display the TpmSupport field.

```
aws ec2 describe-instances --instance-ids i-0123456789example
```

If NitroTPM support is enabled on the instance, "TpmSupport": "v2.0" appears in the output.

```
"Instances": {  
    "InstanceId": "0123456789example",  
    "InstanceType": "c5.large",  
    ...  
    "BootMode": "uefi",  
    "TpmSupport": "v2.0"  
    ...  
}
```

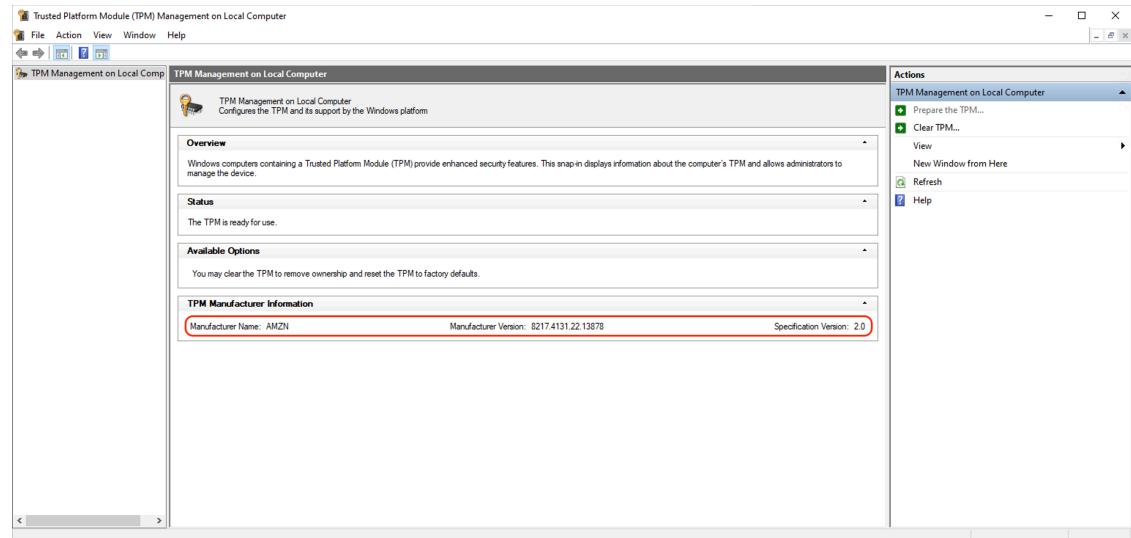

To verify whether NitroTPM is accessible inside an Amazon EC2 Windows instance

1. [Connect to your EC2 Windows instance.](#)
2. On the instance, run the tpm.msc program.

The **TPM Management on Local Computer** window opens.

3. Check the **TPM Manufacturer Information** field. It contains the manufacturer's name and the version of the NitroTPM on the instance.

Amazon Elastic Compute Cloud
User Guide for Windows Instances
Enable or stop using NitroTPM on an instance

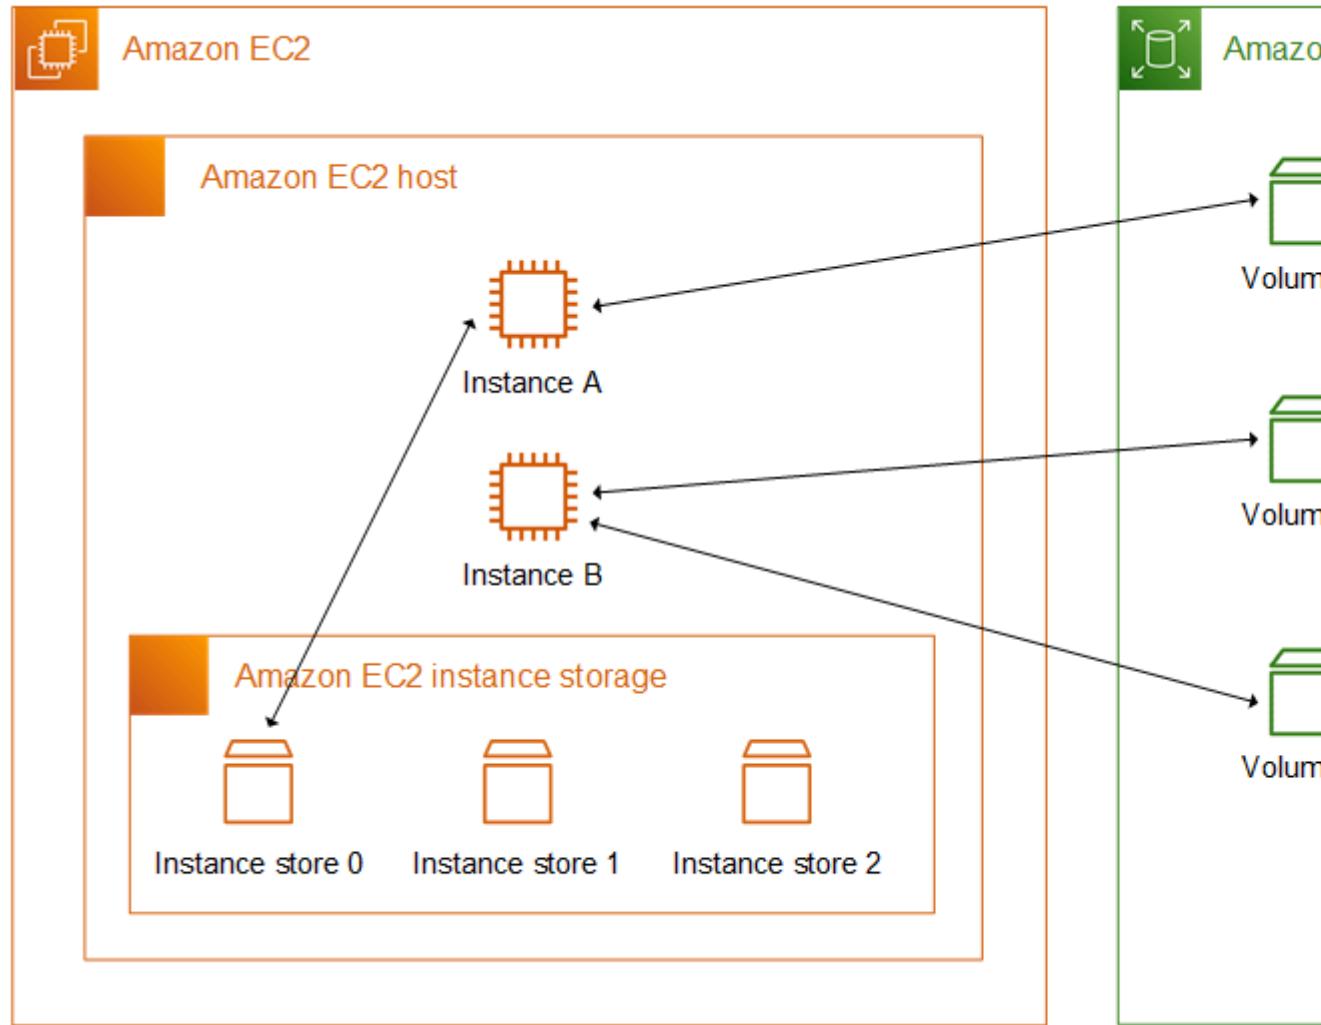

Storage

Amazon EC2 provides you with flexible, cost effective, and easy-to-use data storage options for your instances. Each option has a unique combination of performance and durability. These storage options can be used independently or in combination to suit your requirements.

After reading this section, you should have a good understanding about how you can use the data storage options supported by Amazon EC2 to meet your specific requirements. These storage options include the following:

- [Amazon Elastic Block Store \(p. 1702\)](#)
- [Amazon EC2 instance store \(p. 1996\)](#)
- [Use Amazon S3 with Amazon EC2 \(p. 2013\)](#)

The following figure shows the relationship between these storage options and your instance.

Amazon EBS

Amazon EBS provides durable, block-level storage volumes that you can attach to a running instance. You can use Amazon EBS as a primary storage device for data that requires frequent and granular updates. For example, Amazon EBS is the recommended storage option when you run a database on an instance.

An EBS volume behaves like a raw, unformatted, external block device that you can attach to a single instance. The volume persists independently from the running life of an instance. After an EBS volume is attached to an instance, you can use it like any other physical hard drive. As illustrated in the previous figure, multiple volumes can be attached to an instance. You can also detach an EBS volume from one instance and attach it to another instance. You can dynamically change the configuration of a volume attached to an instance. EBS volumes can also be created as encrypted volumes using the Amazon EBS encryption feature. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

To keep a backup copy of your data, you can create a *snapshot* of an EBS volume, which is stored in Amazon S3. You can create an EBS volume from a snapshot, and attach it to another instance. For more information, see [Amazon Elastic Block Store \(p. 1702\)](#).

Amazon EC2 instance store

Many instances can access storage from disks that are physically attached to the host computer. This disk storage is referred to as *instance store*. Instance store provides temporary block-level storage for instances. The data on an instance store volume persists only during the life of the associated instance; if you stop, hibernate, or terminate an instance, any data on instance store volumes is lost. For more information, see [Amazon EC2 instance store \(p. 1996\)](#).

Amazon S3

Amazon S3 provides access to reliable and inexpensive data storage infrastructure. It is designed to make web-scale computing easier by enabling you to store and retrieve any amount of data, at any time, from within Amazon EC2 or anywhere on the web. For example, you can use Amazon S3 to store backup copies of your data and applications. Amazon EC2 uses Amazon S3 to store EBS snapshots and instance store-backed AMIs. For more information, see [Use Amazon S3 with Amazon EC2 \(p. 2013\)](#).

Adding storage

Every time you launch an instance from an AMI, a root storage device is created for that instance. The root storage device contains all the information necessary to boot the instance. You can specify storage volumes in addition to the root device volume when you create an AMI or launch an instance using *block device mapping*. For more information, see [Block device mappings \(p. 2026\)](#).

You can also attach EBS volumes to a running instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1729\)](#).

Storage pricing

For information about storage pricing, open [AWS Pricing](#), scroll down to **Services Pricing**, choose **Storage**, and then choose the storage option to open that storage option's pricing page. For information about estimating the cost of storage, see the [AWS Pricing Calculator](#).

Amazon Elastic Block Store (Amazon EBS)

Amazon Elastic Block Store (Amazon EBS) provides block level storage volumes for use with EC2 instances. EBS volumes behave like raw, unformatted block devices. You can mount these volumes as devices on your instances. EBS volumes that are attached to an instance are exposed as storage

volumes that persist independently from the life of the instance. You can create a file system on top of these volumes, or use them in any way you would use a block device (such as a hard drive). You can dynamically change the configuration of a volume attached to an instance.

We recommend Amazon EBS for data that must be quickly accessible and requires long-term persistence. EBS volumes are particularly well-suited for use as the primary storage for file systems, databases, or for any applications that require fine granular updates and access to raw, unformatted, block-level storage. Amazon EBS is well suited to both database-style applications that rely on random reads and writes, and to throughput-intensive applications that perform long, continuous reads and writes.

With Amazon EBS, you pay only for what you use. For more information about Amazon EBS pricing, see the Projecting Costs section of the [Amazon Elastic Block Store page](#).

Contents

- [Features of Amazon EBS \(p. 1703\)](#)
- [Amazon EBS volumes \(p. 1704\)](#)

Features of Amazon EBS

- You create an EBS volume in a specific Availability Zone, and then attach it to an instance in that same Availability Zone. To make a volume available outside of the Availability Zone, you can create a snapshot and restore that snapshot to a new volume anywhere in that Region. You can copy snapshots to other Regions and then restore them to new volumes there, making it easier to leverage multiple AWS Regions for geographical expansion, data center migration, and disaster recovery.
- Amazon EBS provides the following volume types: General Purpose SSD, Provisioned IOPS SSD, Throughput Optimized HDD, and Cold HDD. For more information, see [EBS volume types \(p. 1707\)](#).

The following is a summary of performance and use cases for each volume type.

- General Purpose SSD volumes (gp2 and gp3) balance price and performance for a wide variety of transactional workloads. These volumes are ideal for use cases such as boot volumes, medium-size single instance databases, and development and test environments.
- Provisioned IOPS SSD volumes (io1 and io2) are designed to meet the needs of I/O-intensive workloads that are sensitive to storage performance and consistency. They provide a consistent IOPS rate that you specify when you create the volume. This enables you to predictably scale to tens of thousands of IOPS per instance. Additionally, io2 volumes provide the highest levels of volume durability.
- Throughput Optimized HDD volumes (st1) provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. These volumes are ideal for large, sequential workloads such as Amazon EMR, ETL, data warehouses, and log processing.
- Cold HDD volumes (sc1) provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. These volumes are ideal for large, sequential, cold-data workloads. If you require infrequent access to your data and are looking to save costs, these volumes provide inexpensive block storage.

- You can create your EBS volumes as encrypted volumes, in order to meet a wide range of data-at-rest encryption requirements for regulated/audited data and applications. When you create an encrypted EBS volume and attach it to a supported instance type, data stored at rest on the volume, disk I/O, and snapshots created from the volume are all encrypted. The encryption occurs on the servers that host EC2 instances, providing encryption of data-in-transit from EC2 instances to EBS storage. For more information, see [Amazon EBS encryption \(p. 1921\)](#).
- You can create point-in-time snapshots of EBS volumes, which are persisted to Amazon S3. Snapshots protect data for long-term durability, and they can be used as the starting point for new EBS volumes. The same snapshot can be used to create as many volumes as needed. These snapshots can be copied across AWS Regions. For more information, see [Amazon EBS snapshots \(p. 1757\)](#).
- Performance metrics, such as bandwidth, throughput, latency, and average queue length, are available through the AWS Management Console. These metrics, provided by Amazon CloudWatch, allow you to monitor the performance of your volumes to make sure that you are providing enough performance for your applications without paying for resources you don't need. For more information, see [Amazon EBS volume performance on Windows instances \(p. 1965\)](#).

Amazon EBS volumes

An Amazon EBS volume is a durable, block-level storage device that you can attach to your instances. After you attach a volume to an instance, you can use it as you would use a physical hard drive. EBS volumes are flexible. For current-generation volumes attached to current-generation instance types, you can dynamically increase size, modify the provisioned IOPS capacity, and change volume type on live production volumes.

You can use EBS volumes as primary storage for data that requires frequent updates, such as the system drive for an instance or storage for a database application. You can also use them for throughput-intensive applications that perform continuous disk scans. EBS volumes persist independently from the running life of an EC2 instance.

You can attach multiple EBS volumes to a single instance. The volume and instance must be in the same Availability Zone.

Amazon EBS provides the following volume types: General Purpose SSD (gp2 and gp3), Provisioned IOPS SSD (io1 and io2), Throughput Optimized HDD (st1), Cold HDD (sc1), and Magnetic (standard). They differ in performance characteristics and price, allowing you to tailor your storage performance and cost to the needs of your applications. For more information, see [Amazon EBS volume types \(p. 1707\)](#).

Your account has a limit on the total storage available to you. For more information about these limits, and how to request an increase in your limits, see [Amazon EBS endpoints and quotas](#).

For more information about pricing, see [Amazon EBS Pricing](#).

Contents

- [Benefits of using EBS volumes \(p. 1705\)](#)

Benefits of using EBS volumes

EBS volumes provide benefits that are not provided by instance store volumes.

Topics

- [Data availability \(p. 1705\)](#)
- [Data persistence \(p. 1705\)](#)
- [Data encryption \(p. 1706\)](#)
- [Data security \(p. 1706\)](#)
- [Snapshots \(p. 1706\)](#)
- [Flexibility \(p. 1707\)](#)

Data availability

When you create an EBS volume, it is automatically replicated within its Availability Zone to prevent data loss due to failure of any single hardware component. You can attach an EBS volume to any EC2 instance in the same Availability Zone. After you attach a volume, it appears as a native block device similar to a hard drive or other physical device. At that point, the instance can interact with the volume just as it would with a local drive. You can connect to the instance and format the EBS volume with a file system, such as NTFS, and then install applications.

If you attach multiple volumes to a device that you have named, you can stripe data across the volumes for increased I/O and throughput performance.

You can get monitoring data for your EBS volumes, including root device volumes for EBS-backed instances, at no additional charge. For more information about monitoring metrics, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1979\)](#). For information about tracking the status of your volumes, see [EventBridge for Amazon EBS \(p. 1985\)](#).

Data persistence

An EBS volume is off-instance storage that can persist independently from the life of an instance. You continue to pay for the volume usage as long as the data persists.

EBS volumes that are attached to a running instance can automatically detach from the instance with their data intact when the instance is terminated if you uncheck the **Delete on Termination** check box when you configure EBS volumes for your instance on the EC2 console. The volume can then be reattached to a new instance, enabling quick recovery. If the check box for **Delete on Termination** is checked, the volume(s) will delete upon termination of the EC2 instance. If you are using an EBS-backed instance, you can stop and restart that instance without affecting the data stored in the attached volume. The volume remains attached throughout the stop-start cycle. This enables you to process and store the data on your volume indefinitely, only using the processing and storage resources when required. The data persists on the volume until the volume is deleted explicitly. The physical block storage used by deleted EBS volumes is overwritten with zeroes before it is allocated to a new volume. If you are dealing with sensitive data, you should consider encrypting your data manually or storing the data on a volume protected by Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

By default, the root EBS volume that is created and attached to an instance at launch is deleted when that instance is terminated. You can modify this behavior by changing the value of the flag `DeleteOnTermination` to `false` when you launch the instance. This modified value causes the volume to persist even after the instance is terminated, and enables you to attach the volume to another instance.

By default, additional EBS volumes that are created and attached to an instance at launch are not deleted when that instance is terminated. You can modify this behavior by changing the value of the flag `DeleteOnTermination` to `true` when you launch the instance. This modified value causes the volumes to be deleted when the instance is terminated.

Data encryption

For simplified data encryption, you can create encrypted EBS volumes with the Amazon EBS encryption feature. All EBS volume types support encryption. You can use encrypted EBS volumes to meet a wide range of data-at-rest encryption requirements for regulated/audited data and applications. Amazon EBS encryption uses 256-bit Advanced Encryption Standard algorithms (AES-256) and an Amazon-managed key infrastructure. The encryption occurs on the server that hosts the EC2 instance, providing encryption of data-in-transit from the EC2 instance to Amazon EBS storage. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

Amazon EBS encryption uses AWS Key Management Service (AWS KMS) master keys when creating encrypted volumes and any snapshots created from your encrypted volumes. The first time you create an encrypted EBS volume in a region, a default master key is created for you automatically. This key is used for Amazon EBS encryption unless you select a customer master key (CMK) that you created separately using AWS KMS. Creating your own CMK gives you more flexibility, including the ability to create, rotate, disable, define access controls, and audit the encryption keys used to protect your data. For more information, see the [AWS Key Management Service Developer Guide](#).

Data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in **DOD 5220.22-M** (National Industrial Security Program Operating Manual) or **NIST 800-88** (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Snapshots

Amazon EBS provides the ability to create snapshots (backups) of any EBS volume and write a copy of the data in the volume to Amazon S3, where it is stored redundantly in multiple Availability Zones. The volume does not need to be attached to a running instance in order to take a snapshot. As you continue to write data to a volume, you can periodically create a snapshot of the volume to use as a baseline for new volumes. These snapshots can be used to create multiple new EBS volumes or move volumes across Availability Zones. Snapshots of encrypted EBS volumes are automatically encrypted.

When you create a new volume from a snapshot, it's an exact copy of the original volume at the time the snapshot was taken. EBS volumes that are created from encrypted snapshots are automatically encrypted. By optionally specifying a different Availability Zone, you can use this functionality to create a duplicate volume in that zone. The snapshots can be shared with specific AWS accounts or made public. When you create snapshots, you incur charges in Amazon S3 based on the volume's total size. For a successive snapshot of the volume, you are only charged for any additional data beyond the volume's original size.

Snapshots are incremental backups, meaning that only the blocks on the volume that have changed after your most recent snapshot are saved. If you have a volume with 100 GiB of data, but only 5 GiB of data have changed since your last snapshot, only the 5 GiB of modified data is written to Amazon S3. Even though snapshots are saved incrementally, the snapshot deletion process is designed so that you need to retain only the most recent snapshot.

To help categorize and manage your volumes and snapshots, you can tag them with metadata of your choice. For more information, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

To back up your volumes automatically, you can use [Amazon Data Lifecycle Manager \(p. 1859\)](#) or [AWS Backup](#).

Flexibility

EBS volumes support live configuration changes while in production. You can modify volume type, volume size, and IOPS capacity without service interruptions. For more information, see [Amazon EBS Elastic Volumes \(p. 1909\)](#).

Amazon EBS volume types

Amazon EBS provides the following volume types, which differ in performance characteristics and price, so that you can tailor your storage performance and cost to the needs of your applications.

Important

There are several factors that can affect the performance of EBS volumes, such as instance configuration, I/O characteristics, and workload demand. To fully use the IOPS provisioned on an EBS volume, use [EBS-optimized instances \(p. 1941\)](#). For more information about getting the most out of your EBS volumes, see [Amazon EBS volume performance on Windows instances \(p. 1965\)](#).

For more information about pricing, see [Amazon EBS Pricing](#).

Volume types

- [Solid state drive \(SSD\) volumes \(p. 1707\)](#)
- [Hard disk drive \(HDD\) volumes \(p. 1709\)](#)
- [Previous generation volumes \(p. 1709\)](#)

Solid state drive (SSD) volumes

SSD-backed volumes are optimized for transactional workloads involving frequent read/write operations with small I/O size, where the dominant performance attribute is IOPS. SSD-backed volume types include **General Purpose SSD** and **Provisioned IOPS SSD**. The following is a summary of the use cases and characteristics of SSD-backed volumes.

	General Purpose SSD volumes (p. 1710)		Provisioned IOPS SSD volumes (p. 1713)		
Volume type	gp3	gp2	io2 Block Express ‡	io2	io1
Durability	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)		99.999% durability (0.001% annual failure rate)		99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)

	<u>General Purpose SSD volumes (p. 1710)</u>	<u>Provisioned IOPS SSD volumes (p. 1713)</u>	
Use cases	<ul style="list-style-type: none"> Transactional workloads Virtual desktops Medium-sized, single-instance databases Low-latency interactive applications Boot volumes Development and test environments 	Workloads that require: <ul style="list-style-type: none"> Sub-millisecond latency Sustained IOPS performance More than 64,000 IOPS or 1,000 MiB/s of throughput 	<ul style="list-style-type: none"> Workloads that require sustained IOPS performance or more than 16,000 IOPS I/O-intensive database workloads
Volume size	1 GiB - 16 TiB	4 GiB - 64 TiB	4 GiB - 16 TiB
Max IOPS per volume (16 KiB I/O)	16,000	256,000	64,000 †
Max throughput per volume	1,000 MiB/s	250 MiB/s *	4,000 MiB/s
Amazon EBS Multi-attach	Not supported		Supported
Boot volume	Supported		

* The throughput limit is between 128 MiB/s and 250 MiB/s, depending on the volume size. For more information, see [gp2 volume performance \(p. 1711\)](#). Volumes created before **December 3, 2018** that have not been modified since creation might not reach full performance unless you [modify the volume \(p. 1909\)](#).

† To achieve maximum throughput of 1,000 MiB/s, the volume must be provisioned with 64,000 IOPS and it must be attached to an [instance built on the Nitro System \(p. 218\)](#). io1 volumes created before **December 6, 2017** and that have not been modified since creation, might not reach full performance unless you [modify the volume \(p. 1909\)](#).

‡ io2 Block Express volumes are supported with C6a, C6in, C7g, C7gd, C7gn, Inf2, M6a, M6in, M6idn, M7a, M7g, M7gd, M7i, M7i-flex, P5, R5b, R6a, R6in, R6idn, R7g, R7gd, Trn1, Trn1n, X2idn, and X2iedn instances. io2 volumes attached to these instances, during or after launch, automatically run on Block Express. For more information, see [io2 Block Express volumes \(p. 1715\)](#).

For more information about the SSD-backed volume types, see the following:

- [General Purpose SSD volumes \(p. 1710\)](#)

- [Provisioned IOPS SSD volumes \(p. 1713\)](#)

Hard disk drive (HDD) volumes

HDD-backed volumes are optimized for large streaming workloads where the dominant performance attribute is throughput. HDD volume types include **Throughput Optimized HDD** and **Cold HDD**. The following is a summary of the use cases and characteristics of HDD-backed volumes.

	Throughput Optimized HDD volumes (p. 1717)	Cold HDD volumes (p. 1719)
Volume type	st1	sc1
Durability	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)	
Use cases	<ul style="list-style-type: none">• Big data• Data warehouses• Log processing	<ul style="list-style-type: none">• Throughput-oriented storage for data that is infrequently accessed• Scenarios where the lowest storage cost is important
Volume size	125 GiB - 16 TiB	
Max IOPS per volume (1 MiB I/O)	500	250
Max throughput per volume	500 MiB/s	250 MiB/s
Amazon EBS Multi-attach	Not supported	
Boot volume	Not supported	

For more information about the Hard disk drives (HDD) volumes, see [Throughput Optimized HDD and Cold HDD volumes \(p. 1716\)](#).

Previous generation volumes

Magnetic (standard) volumes are previous generation volumes that are backed by magnetic drives. They are suited for workloads with small datasets where data is accessed infrequently and performance is not of primary importance. These volumes deliver approximately 100 IOPS on average, with burst capability of up to hundreds of IOPS, and they can range in size from 1 GiB to 1 TiB.

Tip

Magnetic is a previous generation volume type. If you need higher performance or performance consistency than previous-generation volumes can provide, we recommend using one of the newer volume types.

The following table describes previous-generation EBS volume types.

	Magnetic
Volume type	standard
Use cases	Workloads where data is infrequently accessed

	Magnetic
Volume size	1 GiB-1 TiB
Max IOPS per volume	40–200
Max throughput per volume	40–90 MiB/s
Boot volume	Supported

For more information, see [Previous Generation Volumes](#).

General Purpose SSD volumes

General Purpose SSD (gp2 and gp3) volumes are backed by solid-state drives (SSDs). They balance price and performance for a wide variety of transactional workloads. These include virtual desktops, medium-sized single instance databases, latency sensitive interactive applications, development and test environments, and boot volumes. We recommend these volumes for most workloads.

Amazon EBS offers two types of General Purpose SSD volumes:

- General Purpose SSD (gp3) volumes—latest generation General Purpose SSD volume
- General Purpose SSD (gp2) volumes

Topics

- [General Purpose SSD \(gp3\) volumes \(p. 1710\)](#)
- [General Purpose SSD \(gp2\) volumes \(p. 1711\)](#)

General Purpose SSD (gp3) volumes

General Purpose SSD (gp3) volumes are the latest generation of General Purpose SSD volumes, and the lowest cost SSD volume offered by Amazon EBS. This volume type helps to provide the right balance of price and performance for most applications. It also helps you to scale volume performance independently of volume size. This means that you can provision the required performance without needing to provision additional block storage capacity. Additionally, gp3 volumes offer a 20 percent lower price per GiB than General Purpose SSD (gp2) volumes.

gp3 volumes provide single-digit millisecond latency and 99.8 percent to 99.9 percent volume durability with an annual failure rate (AFR) no higher than 0.2 percent, which translates to a maximum of two volume failures per 1,000 running volumes over a one-year period. AWS designs gp3 volumes to deliver their provisioned performance 99 percent of the time.

Topics

- [gp3 volume performance \(p. 1710\)](#)
- [gp3 volume size \(p. 1711\)](#)
- [Migrate to gp3 from gp2 \(p. 1711\)](#)

gp3 volume performance

Tip

gp3 volumes do not use burst performance. They can indefinitely sustain their full provisioned IOPS and throughput performance.

IOPS performance

gp3 volumes deliver a consistent baseline IOPS performance of 3,000 IOPS, which is included with the price of storage. You can provision additional IOPS (up to a maximum of 16,000) for an additional cost at a ratio of 500 IOPS per GiB of volume size. Maximum IOPS can be provisioned for volumes 32 GiB or larger ($500 \text{ IOPS per GiB} \times 32 \text{ GiB} = 16,000 \text{ IOPS}$).

Throughput performance

gp3 volumes deliver a consistent baseline throughput performance of 125 MiB/s, which is included with the price of storage. You can provision additional throughput (up to a maximum of 1,000 MiB/s) for an additional cost at a ratio of 0.25 MiB/s per provisioned IOPS. Maximum throughput can be provisioned at 4,000 IOPS or higher and 8 GiB or larger ($4,000 \text{ IOPS} \times 0.25 \text{ MiB/s per IOPS} = 1,000 \text{ MiB/s}$).

gp3 volume size

A gp3 volume can range in size from 1 GiB to 16 TiB.

Migrate to gp3 from gp2

If you are currently using gp2 volumes, you can migrate your volumes to gp3 using [Amazon EBS Elastic Volumes \(p. 1909\)](#) operations. You can use Amazon EBS Elastic Volumes operations to modify the volume type, IOPS, and throughput of your existing volumes without interrupting your Amazon EC2 instances. Also, when you create a new volume, launch a new instance, or create an AMI, you can select gp3 as the volume type at that point, instead of using the default gp2 volume type.

To find out how much you can save by migrating your gp2 volumes to gp3, use the [Amazon EBS gp2 to gp3 migration cost savings calculator](#).

General Purpose SSD (gp2) volumes

General Purpose SSD (gp2) volumes are the default Amazon EBS volume type for Amazon EC2 instances. They offer cost-effective storage that is ideal for a broad range of transactional workloads. With gp2 volumes, performance scales with volume size.

Tip

gp3 volumes are the latest generation of General Purpose SSD volumes. They offer more predictable performance scaling and prices that are up to 20 percent lower than gp2 volumes.

For more information, see [General Purpose SSD \(gp3\) volumes \(p. 1710\)](#).

To find out how much you can save by migrating your gp2 volumes to gp3, use the [Amazon EBS gp2 to gp3 migration cost savings calculator](#).

gp2 volumes provide single-digit millisecond latency and 99.8 percent to 99.9 percent volume durability with an annual failure rate (AFR) no higher than 0.2 percent, which translates to a maximum of two volume failures per 1,000 running volumes over a one-year period. AWS designs gp2 volumes to deliver their provisioned performance 99 percent of the time.

Topics

- [gp2 volume performance \(p. 1711\)](#)
- [gp2 volume size \(p. 1713\)](#)

gp2 volume performance

IOPS performance

Baseline IOPS performance scales linearly between a minimum of 100 and a maximum of 16,000 at a rate of 3 IOPS per GiB of volume size. IOPS performance is provisioned as follows:

- Volumes 33.33 GiB and smaller are provisioned with the minimum of 100 IOPS.
- Volumes larger than 33.33 GiB are provisioned with 3 IOPS per GiB of volume size up to the maximum of 16,000 IOPS, which is reached at 5,334 GiB ($3 \times 5,334$).

- Volumes 5,334 GiB and larger are provisioned with 16,000 IOPS.

gp2 volumes smaller than 1 TiB (and that are provisioned with less than 3,000 IOPS) can **burst** to 3,000 IOPS when needed for an extended period of time. A volume's ability to burst is governed by I/O credits. When I/O demand is greater than baseline performance, the volume **spends I/O credits** to burst to the required performance level (up to 3,000 IOPS). While bursting, I/O credits are not accumulated and they are spent at the rate of IOPS that is being used above baseline IOPS (spend rate = burst IOPS - baseline IOPS). The more I/O credits a volume has accrued, the longer it can sustain its burst performance. You can calculate **Burst duration** as follows:

$$\text{Burst duration} = \frac{(\text{I/O credit balance})}{(\text{Burst IOPS}) - (\text{Baseline IOPS})}$$

When I/O demand drops to baseline performance level or lower, the volume starts to **earn I/O credits** at a rate of 3 I/O credits per GiB of volume size per second. Volumes have an **I/O credit accrual limit** of 5.4 million I/O credits, which is enough to sustain the maximum burst performance of 3,000 IOPS for at least 30 minutes.

Note

Each volume receives an initial I/O credit balance of 5.4 million I/O credits, which provides a fast initial boot cycle for boot volumes and a good bootstrapping experience for other applications.

The following table lists example volume sizes and the associated baseline performance of the volume, the burst duration (when starting with 5.4 million I/O credits), and the time needed to refill an empty I/O credits balance.

Volume size (GiB)	Baseline performance (IOPS)	Burst duration at 3,000 IOPS (seconds)	Time to refill empty credit balance (seconds)
1 to 33.33	100	1,862	54,000
100	300	2,000	18,000
334 (min size for max throughput)	1,002	2,703	5,389
750	2,250	7,200	2,400
1,000	3,000	N/A*	N/A*
5,334 (min size for max IOPS) and larger	16,000	N/A*	N/A*

* The baseline performance of the volume exceeds the maximum burst performance.

You can monitor the I/O credit balance for a volume using the Amazon EBS `BurstBalance` metric in Amazon CloudWatch. This metric shows the percentage of I/O credits for gp2 remaining. For more information, see [I/O characteristics and monitoring \(p. 1967\)](#). You can set an alarm that notifies you when the `BurstBalance` value falls to a certain level. For more information, see [Creating CloudWatch Alarms](#).

Throughput performance

gp2 volumes deliver throughput between 128 MiB/s and 250 MiB/s, depending on the volume size. Throughput performance is provisioned as follows:

- Volumes that are 170 GiB and smaller deliver a maximum throughput of 128 MiB/s.
- Volumes larger than 170 GiB but smaller than 334 GiB can burst to a maximum throughput of 250 MiB/s.
- Volumes that are 334 GiB and larger deliver 250 MiB/s.

Throughput for a gp2 volume can be calculated using the following formula, up to the throughput limit of 250 MiB/s:

Throughput in MiB/s = IOPS performance × I/O size in KiB

gp2 volume size

A gp2 volume can range in size from 1 GiB to 16 TiB. Keep in mind that volume performance scales linearly with the volume size.

Provisioned IOPS SSD volumes

Provisioned IOPS SSD volumes are backed by solid-state drives (SSDs). They are the highest performance Amazon EBS storage volumes designed for critical, IOPS-intensive, and throughput-intensive workloads that require low latency.

Amazon EBS offers three types of Provisioned IOPS SSD volumes:

- Provisioned IOPS SSD (io2) volumes
- Provisioned IOPS SSD (io2) Block Express volumes
- Provisioned IOPS SSD (io1) volumes

Topics

- [Provisioned IOPS SSD \(io1 and io2\) volumes \(p. 1713\)](#)
- [io2 Block Express volumes \(p. 1715\)](#)

Provisioned IOPS SSD (io1 and io2) volumes

Provisioned IOPS SSD (io1 and io2) volumes are designed to meet the needs of I/O-intensive workloads, particularly database workloads, that are sensitive to storage performance and consistency. Provisioned IOPS SSD volumes use a consistent IOPS rate, which you specify when you create the volume, and Amazon EBS delivers the provisioned performance 99.9 percent of the time.

io1 volumes are designed to provide 99.8 percent to 99.9 percent volume durability with an annual failure rate (AFR) no higher than 0.2 percent, which translates to a maximum of two volume failures per 1,000 running volumes over a one-year period. io2 volumes are designed to provide 99.999 percent volume durability with an AFR no higher than 0.001 percent, which translates to a single volume failure per 100,000 running volumes over a one-year period.

Provisioned IOPS SSD io1 and io2 volumes are available for all Amazon EC2 instance types. Provisioned IOPS SSD io2 volumes attached to C6a, C6in, C7g, C7gd, C7gn, Inf2, M6a, M6in, M6idn, M7a, M7g, M7gd, M7i, M7i-flex, P5, R5b, R6a, R6in, R6idn, R7g, R7gd, Trn1, Trn1n, X2idn, and X2iedn instances run on EBS Block Express. For more information, see [io2 Block Express volumes \(p. 1715\)](#).

Considerations for io2 volumes

- io2 volumes are currently available in the following Regions: US East (Ohio), US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific

(Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Stockholm), and Middle East (Bahrain).

- Keep the following in mind when **launching instances with io2 volumes**:
 - If you launch an instance with an io2 volume using an instance type that supports Block Express, the volume automatically runs on Block Express, regardless of the volume's size and IOPS.
 - You can't launch an instance type that does not support [Block Express \(p. 1715\)](#) with an io2 volume that has a size greater than 16 TiB or IOPS greater than 64,000.
 - You can't launch an instance with an encrypted io2 volume that has a size greater than 16 TiB or IOPS greater than 64,000 from an unencrypted AMI or a shared encrypted AMI with Block Express. In this case, you must first create an encrypted AMI in your account and then use that AMI to launch the instance.
- Keep the following in mind when **creating io2 volumes**:
 - If you create an io2 volume with a size greater than 16 TiB or IOPS greater than 64,000 in a Region where [Block Express \(p. 1715\)](#) is supported, the volume automatically runs on Block Express.
 - You can't create an io2 volume with a size greater than 16 TiB or IOPS greater than 64,000 in a Region where [Block Express \(p. 1715\)](#) is not supported.
 - If you create an io2 volume with a size of 16 TiB or less and IOPS of 64,000 or less in a Region where [Block Express \(p. 1715\)](#) is supported, the volume does not run on Block Express.
 - You can't create an encrypted io2 volume that has a size greater than 16 TiB or IOPS greater than 64,000 from an unencrypted snapshot or a shared encrypted snapshot. In this case, you must first create an encrypted snapshot in your account and then use that snapshot to create the volume.
- Keep the following in mind when **attaching io2 volumes** to instances:
 - If you attach an io2 volume to an instance that supports Block Express, the volume automatically runs on Block Express. It can take up to 48 hours to optimize the volume for Block Express. During this time, the volume provides io2 latency. After the volume has been optimized, it provides the sub-millisecond latency supported by Block Express.
 - You can't attach an io2 volume with a size greater than 16 TiB or IOPS greater than 64,000 to an instance type that does not support [Block Express \(p. 1715\)](#).
 - If you detach an io2 volume with a size of 16 TiB or less and IOPS of 64,000 or less from an instance that supports Block Express and attach it to an instance type that does not support [Block Express \(p. 1715\)](#), the volume no longer runs on Block Express and it provides io2 latency.
- Keep the following in mind when **modifying io2 volumes**:
 - You can't modify an io2 volume and increase its size beyond 16 TiB or its IOPS beyond 64,000 while it is attached to an instance type that does not support [Block Express \(p. 1715\)](#).

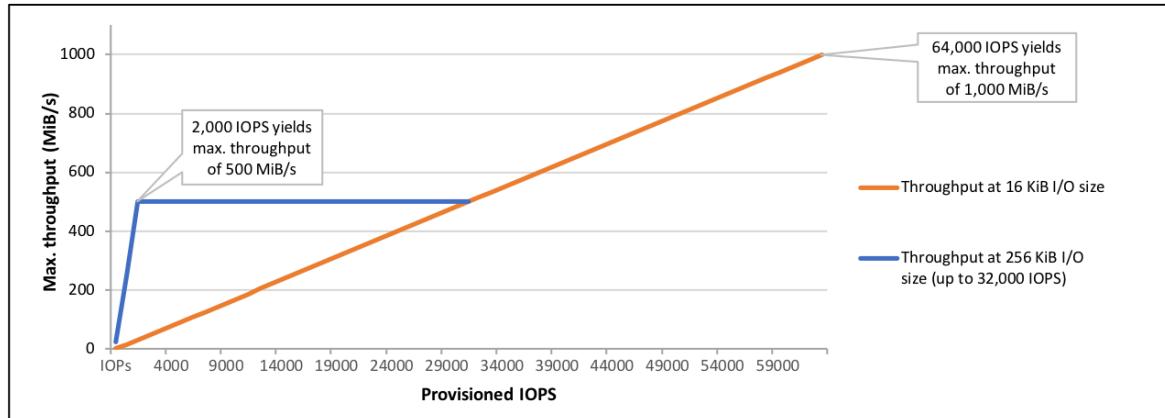

Performance

Provisioned IOPS SSD volumes can range in size from 4 GiB to 16 TiB and you can provision from 100 IOPS up to 64,000 IOPS per volume. You can achieve up to 64,000 IOPS only on [Instances built on the Nitro System \(p. 218\)](#). On other instance families you can achieve performance up to 32,000 IOPS. The maximum ratio of provisioned IOPS to requested volume size (in GiB) is 50:1 for io1 volumes, and 500:1 for io2 volumes. For example, a 100 GiB io1 volume can be provisioned with up to 5,000 IOPS, while a 100 GiB io2 volume can be provisioned with up to 50,000 IOPS. On a supported instance type, the following volume sizes allow provisioning up to the 64,000 IOPS maximum:

- io1 volume 1,280 GiB in size or greater ($50 \times 1,280 \text{ GiB} = 64,000 \text{ IOPS}$)
- io2 volume 128 GiB in size or greater ($500 \times 128 \text{ GiB} = 64,000 \text{ IOPS}$)

Provisioned IOPS SSD volumes provisioned with up to 32,000 IOPS support a maximum I/O size of 256 KiB and yield as much as 500 MiB/s of throughput. With the I/O size at the maximum, peak throughput is reached at 2,000 IOPS. Volumes provisioned with more than 32,000 IOPS (up to the maximum of 64,000 IOPS) yield a linear increase in throughput at a rate of 16 KiB per provisioned IOPS. For

example, a volume provisioned with 48,000 IOPS can support up to 750 MiB/s of throughput ($16 \text{ KiB per provisioned IOPS} \times 48,000 \text{ provisioned IOPS} = 750 \text{ MiB/s}$). To achieve the maximum throughput of 1,000 MiB/s, a volume must be provisioned with 64,000 IOPS ($16 \text{ KiB per provisioned IOPS} \times 64,000 \text{ provisioned IOPS} = 1,000 \text{ MiB/s}$). The following graph illustrates these performance characteristics:

Your per-I/O latency experience depends on the provisioned IOPS and on your workload profile. For the best I/O latency experience, ensure that you provision IOPS to meet the I/O profile of your workload.

io2 Block Express volumes

Note

io2 Block Express volumes are supported with C6a, C6in, C7g, C7gd, C7gn, Inf2, M6a, M6in, M6idn, M7a, M7g, M7gd, M7i, M7i-flex, P5, R5b, R6a, R6in, R6idn, R7g, R7gd, Trn1, Trn1n, X2idn, and X2iedn instances.

io2 Block Express volumes is the next generation of Amazon EBS storage server architecture. It has been built for the purpose of meeting the performance requirements of the most demanding I/O intensive applications that run on Nitro-based Amazon EC2 instances.

Block Express architecture increases performance and scale. Block Express servers communicate with Nitro-based instances using the Scalable Reliable Datagram (SRD) networking protocol. This interface is implemented in the Nitro Card dedicated for Amazon EBS I/O function on the host hardware of the instance. It minimizes I/O delay and latency variation (network jitter), which provides faster and more consistent performance for your applications. For more information, see [io2 Block Express volumes](#).

io2 Block Express volumes are suited for workloads that benefit from a single volume that provides sub-millisecond latency, and supports higher IOPS, higher throughput, and larger capacity than io2 volumes.

io2 Block Express volumes support the same features as io2 volumes, including Multi-Attach and encryption.

Topics

- [Considerations \(p. 1715\)](#)
- [Performance \(p. 1716\)](#)
- [Quotas \(p. 1716\)](#)
- [Pricing and billing \(p. 1716\)](#)

Considerations

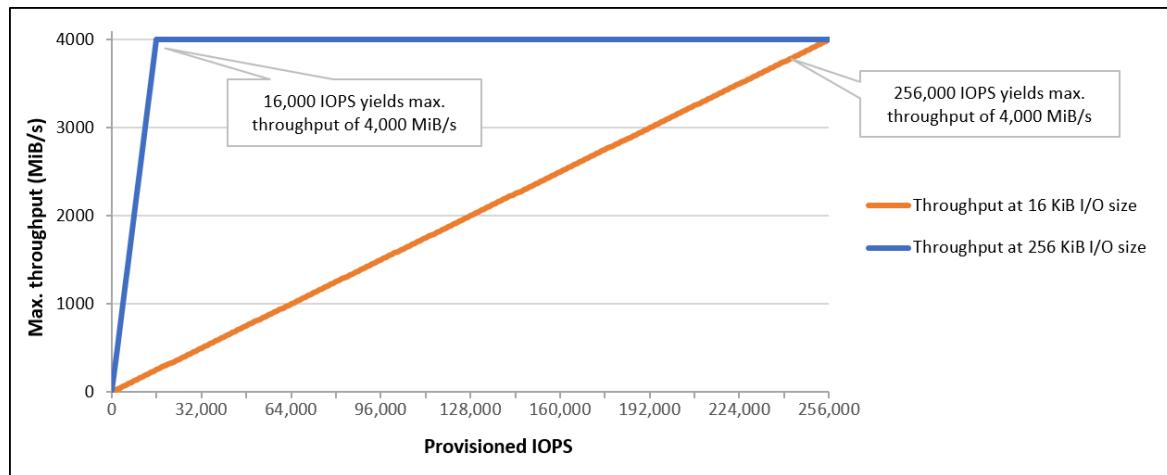

- io2 Block Express volumes are currently supported with C6a, C6in, C7g, C7gd, C7gn, Inf2, M6a, M6in, M6idn, M7a, M7g, M7gd, M7i, M7i-flex, P5, R5b, R6a, R6in, R6idn, R7g, R7gd, Trn1, Trn1n, X2idn, and X2iedn instances.

- io2 Block Express volumes are currently available in all Regions where supported instances are available, including US East (Ohio), US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Instance availability might vary by Availability Zone. For more information, see [Find an Amazon EC2 instance type](#).

Performance

With io2 Block Express volumes, you can provision volumes with:

- Sub-millisecond average latency
- Storage capacity up to 64 TiB (65,536 GiB)
- Provisioned IOPS up to 256,000, with an IOPS:GiB ratio of 1,000:1. Maximum IOPS can be provisioned with volumes 256 GiB in size and larger ($1,000 \text{ IOPS} \times 256 \text{ GiB} = 256,000 \text{ IOPS}$).
- Volume throughput up to 4,000 MiB/s. Throughput scales proportionally up to 0.256 MiB/s per provisioned IOPS. Maximum throughput can be achieved at 16,000 IOPS or higher.

Quotas

io2 Block Express volumes adhere to the same service quotas as io2 volumes. For more information, see [Amazon EBS quotas](#).

Pricing and billing

io2 volumes and io2 Block Express volumes are billed at the same rate. For more information, see [Amazon EBS pricing](#).

Usage reports do not distinguish between io2 Block Express volumes and io2 volumes. We recommend that you use tags to help you identify costs associated with io2 Block Express volumes.

Throughput Optimized HDD and Cold HDD volumes

The HDD-backed volumes provided by Amazon EBS fall into these categories:

- Throughput Optimized HDD — A low-cost HDD designed for frequently accessed, throughput-intensive workloads.
- Cold HDD — The lowest-cost HDD design for less frequently accessed workloads.

Topics

- [Limitations on per-instance throughput \(p. 1717\)](#)
- [Throughput Optimized HDD volumes \(p. 1717\)](#)
- [Cold HDD volumes \(p. 1719\)](#)
- [Performance considerations when using HDD volumes \(p. 1722\)](#)
- [Monitor the burst bucket balance for volumes \(p. 1724\)](#)

Limitations on per-instance throughput

Throughput for st1 and sc1 volumes is always determined by the smaller of the following:

- Throughput limits of the volume
- Throughput limits of the instance

As for all Amazon EBS volumes, we recommend that you select an appropriate EBS-optimized EC2 instance to avoid network bottlenecks. For more information, see [Amazon EBS-optimized instances \(p. 1941\)](#).

Throughput Optimized HDD volumes

Throughput Optimized HDD (st1) volumes provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. This volume type is a good fit for large, sequential workloads such as Amazon EMR, ETL, data warehouses, and log processing. Bootable st1 volumes are not supported.

Throughput Optimized HDD (st1) volumes, though similar to Cold HDD (sc1) volumes, are designed to support *frequently* accessed data.

This volume type is optimized for workloads involving large, sequential I/O, and we recommend that customers with workloads performing small, random I/O use gp2. For more information, see [Inefficiency of small read/writes on HDD \(p. 1723\)](#).

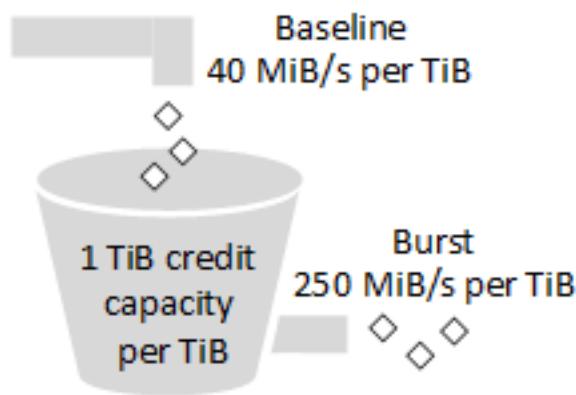

Throughput Optimized HDD (st1) volumes attached to EBS-optimized instances are designed to offer consistent performance, delivering at least 90 percent of the expected throughput performance 99 percent of the time in a given year.

Throughput credits and burst performance

Like gp2, st1 uses a burst bucket model for performance. Volume size determines the baseline throughput of your volume, which is the rate at which the volume accumulates throughput credits. Volume size also determines the burst throughput of your volume, which is the rate at which you can spend credits when they are available. Larger volumes have higher baseline and burst throughput. The more credits your volume has, the longer it can drive I/O at the burst level.

The following diagram shows the burst bucket behavior for st1.

ST1 burst bucket

Subject to throughput and throughput-credit caps, the available throughput of an st1 volume is expressed by the following formula:

$$(Volume\ size) \times (Credit\ accumulation\ rate\ per\ TiB) = Throughput$$

For a 1-TiB st1 volume, burst throughput is limited to 250 MiB/s, the bucket fills with credits at 40 MiB/s, and it can hold up to 1 TiB-worth of credits.

Larger volumes scale these limits linearly, with throughput capped at a maximum of 500 MiB/s. After the bucket is depleted, throughput is limited to the baseline rate of 40 MiB/s per TiB.

On volume sizes ranging from 0.125 TiB to 16 TiB, baseline throughput varies from 5 MiB/s to a cap of 500 MiB/s, which is reached at 12.5 TiB as follows:

$$12.5 \text{ TiB} \times \frac{40 \text{ MiB/s}}{1 \text{ TiB}} = 500 \text{ MiB/s}$$

Burst throughput varies from 31 MiB/s to a cap of 500 MiB/s, which is reached at 2 TiB as follows:

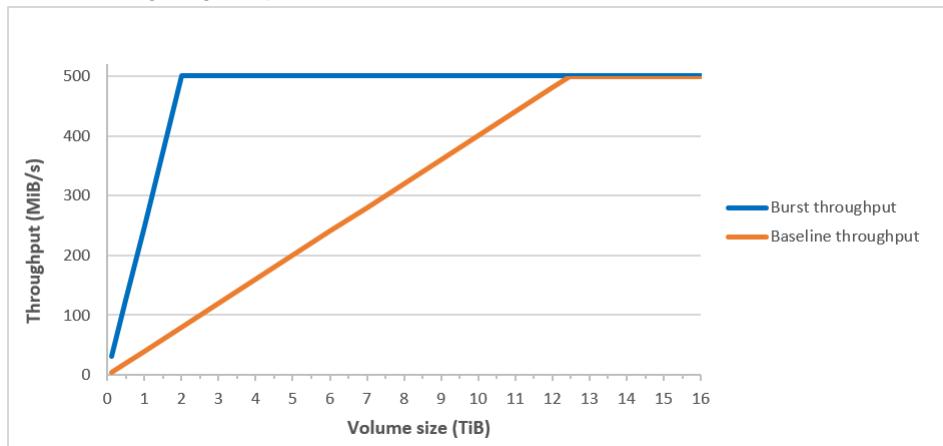

$$2 \text{ TiB} \times \frac{250 \text{ MiB/s}}{1 \text{ TiB}} = 500 \text{ MiB/s}$$

The following table states the full range of base and burst throughput values for st1.

Volume size (TiB)	ST1 base throughput (MiB/s)	ST1 burst throughput (MiB/s)
0.125	5	31
0.5	20	125
1	40	250
2	80	500
3	120	500

Volume size (TiB)	ST1 base throughput (MiB/s)	ST1 burst throughput (MiB/s)
4	160	500
5	200	500
6	240	500
7	280	500
8	320	500
9	360	500
10	400	500
11	440	500
12	480	500
12.5	500	500
13	500	500
14	500	500
15	500	500
16	500	500

The following diagram plots the table values:

Note

When you create a snapshot of a Throughput Optimized HDD (st1) volume, performance may drop as far as the volume's baseline value while the snapshot is in progress.

For information about using CloudWatch metrics and alarms to monitor your burst bucket balance, see [Monitor the burst bucket balance for volumes \(p. 1724\)](#).

Cold HDD volumes

Cold HDD (sc1) volumes provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. With a lower throughput limit than st1, sc1 is a good fit for large, sequential cold-data workloads. If you require infrequent access to your data and are looking to save costs, sc1 provides inexpensive block storage. Bootable sc1 volumes are not supported.

Cold HDD (sc1) volumes, though similar to Throughput Optimized HDD (st1) volumes, are designed to support *infrequently* accessed data.

Note

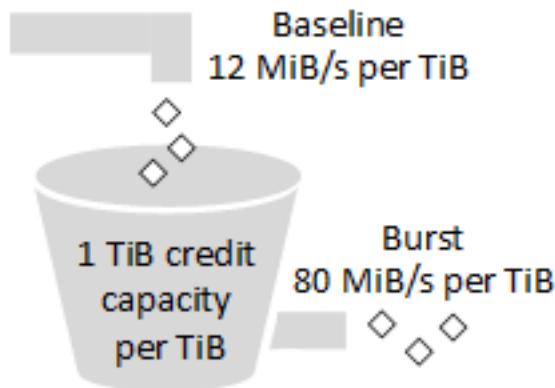

This volume type is optimized for workloads involving large, sequential I/O, and we recommend that customers with workloads performing small, random I/O use gp2. For more information, see [Inefficiency of small read/writes on HDD \(p. 1723\)](#).

Cold HDD (sc1) volumes attached to EBS-optimized instances are designed to offer consistent performance, delivering at least 90 percent of the expected throughput performance 99 percent of the time in a given year.

Throughput credits and burst performance

Like gp2, sc1 uses a burst bucket model for performance. Volume size determines the baseline throughput of your volume, which is the rate at which the volume accumulates throughput credits. Volume size also determines the burst throughput of your volume, which is the rate at which you can spend credits when they are available. Larger volumes have higher baseline and burst throughput. The more credits your volume has, the longer it can drive I/O at the burst level.

SC1 burst bucket

Subject to throughput and throughput-credit caps, the available throughput of an sc1 volume is expressed by the following formula:

$$(\text{Volume size}) \times (\text{Credit accumulation rate per TiB}) = \text{Throughput}$$

For a 1-TiB sc1 volume, burst throughput is limited to 80 MiB/s, the bucket fills with credits at 12 MiB/s, and it can hold up to 1 TiB-worth of credits.

Larger volumes scale these limits linearly, with throughput capped at a maximum of 250 MiB/s. After the bucket is depleted, throughput is limited to the baseline rate of 12 MiB/s per TiB.

On volume sizes ranging from 0.125 TiB to 16 TiB, baseline throughput varies from 1.5 MiB/s to a maximum of 192 MiB/s, which is reached at 16 TiB as follows:

$$12 \text{ MiB/s} \\ 16 \text{ TiB} \times \frac{\text{-----}}{1 \text{ TiB}} = 192 \text{ MiB/s}$$

Burst throughput varies from 10 MiB/s to a cap of 250 MiB/s, which is reached at 3.125 TiB as follows:

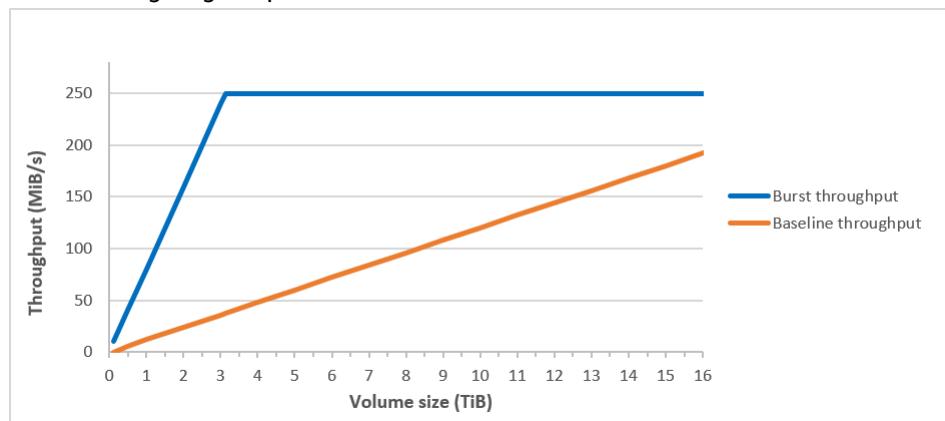

$$80 \text{ MiB/s} \\ 3.125 \text{ TiB} \times \frac{\text{-----}}{1 \text{ TiB}} = 250 \text{ MiB/s}$$

1 TiB

The following table states the full range of base and burst throughput values for sc1:

Volume Size (TiB)	SC1 Base Throughput (MiB/s)	SC1 Burst Throughput (MiB/s)
0.125	1.5	10
0.5	6	40
1	12	80
2	24	160
3	36	240
3.125	37.5	250
4	48	250
5	60	250
6	72	250
7	84	250
8	96	250
9	108	250
10	120	250
11	132	250
12	144	250
13	156	250
14	168	250
15	180	250
16	192	250

The following diagram plots the table values:

Note

When you create a snapshot of a Cold HDD (sc1) volume, performance may drop as far as the volume's baseline value while the snapshot is in progress.

For information about using CloudWatch metrics and alarms to monitor your burst bucket balance, see [Monitor the burst bucket balance for volumes \(p. 1724\)](#).

Performance considerations when using HDD volumes

For optimal throughput results using HDD volumes, plan your workloads with the following considerations in mind.

Comparing Throughput Optimized HDD and Cold HDD

The st1 and sc1 bucket sizes vary according to volume size, and a full bucket contains enough tokens for a full volume scan. However, larger st1 and sc1 volumes take longer for the volume scan to complete because of per-instance and per-volume throughput limits. Volumes attached to smaller instances are limited to the per-instance throughput rather than the st1 or sc1 throughput limits.

Both st1 and sc1 are designed for performance consistency of 90 percent of burst throughput 99 percent of the time. Non-compliant periods are approximately uniformly distributed, targeting 99 percent of expected total throughput each hour.

In general, scan times are expressed by this formula:

$$\frac{\text{Volume size}}{\text{Throughput}} = \frac{\text{Scan time}}$$

For example, taking the performance consistency guarantees and other optimizations into account, an st1 customer with a 5-TiB volume can expect to complete a full volume scan in 2.91 to 3.27 hours.

- Optimal scan time

$$\frac{5 \text{ TiB}}{500 \text{ MiB/s}} = \frac{5 \text{ TiB}}{0.00047684 \text{ TiB/s}} = 10,486 \text{ seconds} = 2.91 \text{ hours}$$

- Maximum scan time

$$\frac{2.91 \text{ hours}}{(0.90)(0.99)} = 3.27 \text{ hours}$$

--- From expected performance of 90% of burst 99% of the time

Similarly, an sc1 customer with a 5-TiB volume can expect to complete a full volume scan in 5.83 to 6.54 hours.

- Optimal scan time

$$\frac{5 \text{ TiB}}{250 \text{ MiB/s}} = \frac{5 \text{ TiB}}{0.000238418 \text{ TiB/s}} = 20972 \text{ seconds} = 5.83 \text{ hours}$$

- Maximum scan time

$$5.83 \text{ hours}$$

-----	= 6.54 hours (0.90)(0.99)
-------	------------------------------

The following table shows ideal scan times for volumes of various size, assuming full buckets and sufficient instance throughput.

Volume size (TiB)	ST1 scan time with burst (hours)*	SC1 scan time with burst (hours)*
1	1.17	3.64
2	1.17	3.64
3	1.75	3.64
4	2.33	4.66
5	2.91	5.83
6	3.50	6.99
7	4.08	8.16
8	4.66	9.32
9	5.24	10.49
10	5.83	11.65
11	6.41	12.82
12	6.99	13.98
13	7.57	15.15
14	8.16	16.31
15	8.74	17.48
16	9.32	18.64

* These scan times assume an average queue depth (rounded to the nearest whole number) of four or more when performing 1 MiB of sequential I/O.

Therefore if you have a throughput-oriented workload that needs to complete scans quickly (up to 500 MiB/s), or requires several full volume scans a day, use st1. If you are optimizing for cost, your data is relatively infrequently accessed, and you don't need more than 250 MiB/s of scanning performance, then use sc1.

Inefficiency of small read/writes on HDD

The performance model for st1 and sc1 volumes is optimized for sequential I/Os, favoring high-throughput workloads, offering acceptable performance on workloads with mixed IOPS and throughput, and discouraging workloads with small, random I/O.

For example, an I/O request of 1 MiB or less counts as a 1 MiB I/O credit. However, if the I/Os are sequential, they are merged into 1 MiB I/O blocks and count only as a 1 MiB I/O credit.

Monitor the burst bucket balance for volumes

You can monitor the burst bucket level for `st1` and `sc1` volumes using the Amazon EBS `BurstBalance` metric available in Amazon CloudWatch. This metric shows the throughput credits for `st1` and `sc1` remaining in the burst bucket. For more information about the `BurstBalance` metric and other metrics related to I/O, see [I/O characteristics and monitoring \(p. 1967\)](#). CloudWatch also allows you to set an alarm that notifies you when the `BurstBalance` value falls to a certain level. For more information, see [Creating CloudWatch Alarms](#).

Constraints on the size and configuration of an EBS volume

The size of an Amazon EBS volume is constrained by the physics and arithmetic of block data storage, as well as by the implementation decisions of operating system (OS) and file system designers. AWS imposes additional limits on volume size to safeguard the reliability of its services.

The following sections describe the most important factors that limit the usable size of an EBS volume and offer recommendations for configuring your EBS volumes.

Contents

- [Storage capacity \(p. 1724\)](#)
- [Service limitations \(p. 1724\)](#)
- [Partitioning schemes \(p. 1725\)](#)
- [Data block sizes \(p. 1726\)](#)

Storage capacity

The following table summarizes the theoretical and implemented storage capacities for the most commonly used file systems on Amazon EBS, assuming a 4,096 byte block size.

Partitioning scheme	Max addressable blocks	Theoretical max size (blocks × block size)	Ext4 implemented max size*	XFS implemented max size**	NTFS implemented max size	Max supported by EBS
MBR	2^{32}	2 TiB	2 TiB	2 TiB	2 TiB	2 TiB
GPT	2^{64}	64 ZiB	1 EiB = 1024^2 TiB (50 TiB certified on RHEL7)	500 TiB (certified on RHEL7)	256 TiB	64 TiB †

* https://ext4.wiki.kernel.org/index.php/Ext4_Howto and <https://access.redhat.com/solutions/1532>

** <https://access.redhat.com/solutions/1532>

† io2 Block Express volumes support up to 64 TiB for GPT partitions. For more information, see [io2 Block Express volumes \(p. 1715\)](#).

Service limitations

Amazon EBS abstracts the massively distributed storage of a data center into virtual hard disk drives. To an operating system installed on an EC2 instance, an attached EBS volume appears to be a physical hard disk drive containing 512-byte disk sectors. The OS manages the allocation of data blocks (or clusters) onto those virtual sectors through its storage management utilities. The allocation is in conformity with

a volume partitioning scheme, such as master boot record (MBR) or GUID partition table (GPT), and within the capabilities of the installed file system (ext4, NTFS, and so on).

EBS is not aware of the data contained in its virtual disk sectors; it only ensures the integrity of the sectors. This means that AWS actions and OS actions are independent of each other. When you are selecting a volume size, be aware of the capabilities and limits of both, as in the following cases:

- EBS currently supports a maximum volume size of 64 TiB. This means that you can create an EBS volume as large as 64 TiB, but whether the OS recognizes all of that capacity depends on its own design characteristics and on how the volume is partitioned.
- Windows boot volumes may use either the MBR or GPT partitioning scheme. The AMI you launch an instance from determines the boot mode parameter and subsequently which partition scheme can be used for the boot volume. MBR supports boot volumes up to 2047 GiB (2 TiB - 1 GiB). If your Windows AMI uses MBR, your boot volume is limited to 2047 GiB, but your non-boot volumes do not have this limit. For more information, see [Make an Amazon EBS volume available for use on Windows \(p. 1731\)](#) and [Set the boot mode of an AMI](#).
- Windows non-boot volumes that are 2 TiB (2048 GiB) or larger must use a GPT partition table to access the entire volume. If an EBS volume over 2 TiB in size is attached to a Windows instance at launch, it is automatically formatted with a GPT partition table. If you attach an EBS volume over 2 TiB in size to a Windows instance after launch, you must initialize it with a GPT table manually. For more information, see [Make an Amazon EBS volume available for use on Windows \(p. 1731\)](#).

Partitioning schemes

Among other impacts, the partitioning scheme determines how many logical data blocks can be uniquely addressed in a single volume. For more information, see [Data block sizes \(p. 1726\)](#). The common partitioning schemes in use are *Master Boot Record* (MBR) and *GUID partition table* (GPT). The important differences between these schemes can be summarized as follows.

MBR

MBR uses a 32-bit data structure to store block addresses. This means that each data block is mapped with one of 2^{32} possible integers. The maximum addressable size of a volume is given by the following formula:

$$2^{32} \times \text{Block size}$$

The block size for MBR volumes is conventionally limited to 512 bytes. Therefore:

$$2^{32} \times 512 \text{ bytes} = 2 \text{ TiB}$$

Engineering workarounds to increase this 2-TiB limit for MBR volumes have not met with widespread industry adoption. Consequently, Linux and Windows never detect an MBR volume as being larger than 2 TiB even if AWS shows its size to be larger.

GPT

GPT uses a 64-bit data structure to store block addresses. This means that each data block is mapped with one of 2^{64} possible integers. The maximum addressable size of a volume is given by the following formula:

$$2^{64} \times \text{Block size}$$

The block size for GPT volumes is commonly 4,096 bytes. Therefore:

$$\begin{aligned} 2^{64} \times 4,096 \text{ bytes} \\ = 2^{64} \times 2^{12} \text{ bytes} \end{aligned}$$

$$\begin{aligned} &= 2^{70} \times 2^6 \text{ bytes} \\ &= 64 \text{ ZiB} \end{aligned}$$

Real-world computer systems don't support anything close to this theoretical maximum. Implemented file-system size is currently limited to 50 TiB for ext4 and 256 TiB for NTFS.

Data block sizes

Data storage on a modern hard drive is managed through *logical block addressing*, an abstraction layer that allows the operating system to read and write data in logical blocks without knowing much about the underlying hardware. The OS relies on the storage device to map the blocks to its physical sectors. EBS advertises 512-byte sectors to the operating system, which reads and writes data to disk using data blocks that are a multiple of the sector size.

The industry default size for logical data blocks is currently 4,096 bytes (4 KiB). Because certain workloads benefit from a smaller or larger block size, file systems support non-default block sizes that can be specified during formatting. Scenarios in which non-default block sizes should be used are outside the scope of this topic, but the choice of block size has consequences for the storage capacity of the volume. The following table shows storage capacity as a function of block size:

Block size	Max volume size
4 KiB (default)	16 TiB
8 KiB	32 TiB
16 KiB	64 TiB
32 KiB	128 TiB
64 KiB (maximum)	256 TiB

The EBS-imposed limit on volume size (64 TiB) is currently equal to the maximum size enabled by 16-KiB data blocks.

Create an Amazon EBS volume

You can create an Amazon EBS volume and then attach it to any EC2 instance in the same Availability Zone. If you create an encrypted EBS volume, you can only attach it to supported instance types. For more information, see [Supported instance types \(p. 1923\)](#).

If you are creating a volume for a high-performance storage scenario, you should make sure to use a Provisioned IOPS SSD volume (io1 or io2) and attach it to an instance with enough bandwidth to support your application, such as an EBS-optimized instance. The same advice holds for Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes. For more information, see [Amazon EBS-optimized instances \(p. 1941\)](#).

Note

If you create a volume for use with a Windows instance, and it's larger than 2048 GiB (or is a volume that's smaller than 2048 GiB but might be increased later), ensure that you configure the volume to use GPT partition tables. For more information, see [Windows support for hard disks that are larger than 2 TB..](#)

Empty EBS volumes receive their maximum performance the moment that they are available and do not require initialization (formerly known as pre-warming). However, storage blocks on volumes that were created from snapshots must be initialized (pulled down from Amazon S3 and written to the volume) before you can access the block. This preliminary action takes time and can cause a significant increase in the latency of an I/O operation the first time each block is accessed. Volume performance is achieved after all blocks have been downloaded and written to the volume. For most applications, amortizing this

cost over the lifetime of the volume is acceptable. To avoid this initial performance hit in a production environment, you can force immediate initialization of the entire volume or enable fast snapshot restore. For more information, see [Initialize Amazon EBS volumes \(p. 1970\)](#).

Important

If you create an io2 volume with a size greater than 16 TiB or with IOPS greater than 64,000 in a Region where EBS Block Express is supported, the volume automatically runs on Block Express. io2 Block Express volumes can be attached to supported instances only. For more information, see [io2 Block Express volumes](#).

Methods of creating a volume

- Create and attach EBS volumes when you launch instances by specifying a block device mapping. For more information, see [Launch an instance using the new launch instance wizard \(p. 552\)](#) and [Block device mappings \(p. 2026\)](#).
- Create an empty EBS volume and attach it to a running instance. For more information, see [Create an empty volume \(p. 1727\)](#) below.
- Create an EBS volume from a previously created snapshot and attach it to a running instance. For more information, see [Create a volume from a snapshot \(p. 1728\)](#) below.

Create an empty volume

Empty volumes receive their maximum performance the moment that they are available and do not require initialization.

You can create an empty EBS volume using one of the following methods.

Console

To create an empty EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Choose **Create volume**.
4. For **Volume type**, choose the type of volume to create. For more information, see [Amazon EBS volume types \(p. 1707\)](#).
5. For **Size**, enter the size of the volume, in GiB. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1724\)](#).
6. (io1, io2, and gp3 only) For **IOPS**, enter the maximum number of input/output operations per second (IOPS) that the volume should provide.
7. (gp3 only) For **Throughput**, enter the throughput that the volume should provide, in MiB/s.
8. For **Availability Zone**, choose the Availability Zone in which to create the volume. A volume can be attached only to an instance that is in the same Availability Zone.
9. For **Snapshot ID**, keep the default value (**Don't create volume from a snapshot**).
10. Set the encryption status for the volume.

If your account is enabled for [encryption by default \(p. 1925\)](#), then encryption is automatically enabled and you can't disable it. You can choose the KMS key to use to encrypt the volume.

If your account is not enabled for encryption by default, encryption is optional. To encrypt the volume, for **Encryption**, choose **Encrypt this volume** and then select the KMS key to use to encrypt the volume.

Note

Encrypted volumes can be attached only to instances that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

11. (Optional) To assign custom tags to the volume, in the **Tags** section, choose **Add tag**, and then enter a tag key and value pair. For more information, see [Tag your Amazon EC2 resources \(p. 2085\)](#).
12. Choose **Create volume**.

Note

The volume is ready for use when the **Volume state** is **available**.

13. To use the volume, attach it to an instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1729\)](#).

AWS CLI

To create an empty EBS volume using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [create-volume \(AWS CLI\)](#)
- [New-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

The volume is ready for use when the state is available.

Create a volume from a snapshot

Volumes created from snapshots load lazily in the background. This means that there is no need to wait for all of the data to transfer from Amazon S3 to your EBS volume before the instance can start accessing an attached volume and all its data. If your instance accesses data that hasn't yet been loaded, the volume immediately downloads the requested data from Amazon S3, and then continues loading the rest of the volume data in the background. Volume performance is achieved after all blocks are downloaded and written to the volume. To avoid the initial performance hit in a production environment, see [Initialize Amazon EBS volumes \(p. 1970\)](#).

New EBS volumes that are created from encrypted snapshots are automatically encrypted. You can also encrypt a volume on-the-fly while restoring it from an unencrypted snapshot. Encrypted volumes can only be attached to instance types that support EBS encryption. For more information, see [Supported instance types \(p. 1923\)](#).

You can create a volume from a snapshot using one of the following methods.

Console

To create an EBS volume from a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Choose **Create volume**.
4. For **Volume type**, choose the type of volume to create. For more information, see [Amazon EBS volume types \(p. 1707\)](#).
5. For **Size**, enter the size of the volume, in GiB. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1724\)](#).
6. (io1, io2, and gp3 only) For **IOPS**, enter the maximum number of input/output operations per second (IOPS) that the volume should provide.
7. (gp3 only) For **Throughput**, enter the throughput that the volume should provide, in MiB/s.
8. For **Availability Zone**, choose the Availability Zone in which to create the volume. A volume can be attached only to instances that are in the same Availability Zone.

9. For **Snapshot ID**, select the snapshot from which to create the volume.
10. Set the encryption status for the volume.

If the selected snapshot is encrypted, or if your account is enabled for [encryption by default \(p. 1925\)](#), then encryption is automatically enabled and you can't disable it. You can choose the KMS key to use to encrypt the volume.

If the selected snapshot is unencrypted and your account is not enabled for encryption by default, encryption is optional. To encrypt the volume, for **Encryption**, choose **Encrypt this volume** and then select the KMS key to use to encrypt the volume.

Note

Encrypted volumes can be attached only to instances that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

11. (Optional) To assign custom tags to the volume, in the **Tags** section, choose **Add tag**, and then enter a tag key and value pair. For more information, see [Tag your Amazon EC2 resources \(p. 2085\)](#).
12. Choose **Create Volume**.

Note

The volume is ready for use when the **Volume state** is **available**.

13. To use the volume, attach it to an instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1729\)](#).

AWS CLI

To create an EBS volume from a snapshot using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [create-volume \(AWS CLI\)](#)
- [New-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

The volume is ready for use when the state is available.

Attach an Amazon EBS volume to an instance

You can attach an available EBS volume to one or more of your instances that is in the same Availability Zone as the volume.

For information about adding EBS volumes to your instance at launch, see [Instance block device mapping \(p. 2031\)](#).

Prerequisites

- Determine how many volumes you can attach to your instance. The maximum number of Amazon EBS volumes that you can attach to an instance depends on the instance type and instance size. For more information, see [Instance volume limits \(p. 2019\)](#).
- If a volume is encrypted, you can attach it only to an instance that supports Amazon EBS encryption. For more information, see [Supported instance types \(p. 1923\)](#).
- If a volume has an AWS Marketplace product code:
 - You can attach a volume only to a stopped instance.
 - You must be subscribed to the AWS Marketplace code that is on the volume.

- The instance's configuration, such as its type and operating system, must support that specific AWS Marketplace code. For example, you cannot take a volume from a Windows instance and attach it to a Linux instance.
- AWS Marketplace product codes are copied from the volume to the instance.

Important

If you attach an io2 volume to an instance that supports Block Express, the volume always runs on Block Express. For more information, see [io2 Block Express volumes](#).

You can attach a volume to an instance using one of the following methods.

Console

To attach an EBS volume to an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume to attach and choose **Actions, Attach volume**.

Note

You can attach only volumes that are in the Available state.

4. For **Instance**, enter the ID of the instance or select the instance from the list of options.

Note

- The volume must be attached to an instance in the same Availability Zone.

• If the volume is encrypted, it can only be attached to instance types that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

5. For **Device name**, enter a supported device name for the volume. This device name is used by Amazon EC2. The block device driver for the instance might assign a different device name when mounting the volume. For more information, see [Device names on Windows instances \(p. 2024\)](#).
6. Choose **Attach volume**.
7. Connect to the instance and mount the volume. For more information, see [Make an Amazon EBS volume available for use on Windows \(p. 1731\)](#).

AWS CLI

To attach an EBS volume to an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [attach-volume](#) (AWS CLI)
- [Add-EC2Volume](#) (AWS Tools for Windows PowerShell)

Note

- If you attempt to attach a number of volumes that exceeds the instance type's volume limit, the request fails. For more information, see [Instance volume limits \(p. 2019\)](#).
- In some situations, you may find that a volume other than the volume attached to /dev/xvda or /dev/sda has become the root volume of your instance. This can happen when you have attached the root volume of another instance, or a volume created from the snapshot of a root volume, to an instance with an existing root volume. For more information, see [Boot from the wrong volume](#).

Make an Amazon EBS volume available for use on Windows

After you attach an Amazon EBS volume to your instance that runs on Xen hypervisor, it is exposed as a block device, and appears as a removable disk in Windows. You can format the volume with any file system and then mount it. After you make the EBS volume available for use, you can access it in the same ways that you access any other volume. Any data written to this file system is written to the EBS volume and is transparent to applications using the device.

On Nitro instances, the Amazon EBS volume is exposed as a block device when the NVM Express (NVMe) controller scans the PCI bus. The disk does not appear as removable. Unlike Xen-based instances, there is only one NVMe controller per EBS volume on Nitro instances.

You can take snapshots of your EBS volume for backup purposes or to use as a baseline when you create another volume. For more information, see [Amazon EBS snapshots \(p. 1757\)](#).

If the EBS volume you are preparing for use is greater than 2 TiB, you must use a GPT partitioning scheme to access the entire volume. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1724\)](#).

You can get directions for volumes on a Linux instance from [Make a volume available for use on Linux](#) in the *Amazon EC2 User Guide for Linux Instances*.

PowerShell

To make all EBS volumes with raw partitions available to use with Windows PowerShell

1. Log in to your Windows instance using Remote Desktop. For more information, see [Connect to your Windows instance \(p. 626\)](#).
2. On the taskbar, open the Start menu, and choose **Windows PowerShell**.
3. Use the provided series of Windows PowerShell commands within the opened PowerShell prompt. The script performs the following actions by default:
 1. Stops the ShellHWDetection service.
 2. Enumerates disks where the partition style is raw.
 3. Creates a new partition that spans the maximum size the disk and partition type will support.
 4. Assigns an available drive letter.
 5. Formats the file system as NTFS with the specified file system label.
 6. Starts the ShellHWDetection service again.

```
Stop-Service -Name ShellHWDetection
Get-Disk | Where PartitionStyle -eq 'raw' | Initialize-Disk -PartitionStyle MBR
-PassThru | New-Partition -AssignDriveLetter -UseMaximumSize | Format-Volume -
FileSystem NTFS -NewFileSystemLabel "Volume Label" -Confirm:$false
Start-Service -Name ShellHWDetection
```

DiskPart command line tool

To make an EBS volume available to use with the DiskPart command line tool

1. Log in to your Windows instance using Remote Desktop. For more information, see [Connect to your Windows instance \(p. 626\)](#).
2. Determine the disk number that you want to make available:
 1. Open the Start menu, and select Windows PowerShell.

2. Use the Get-Disk Cmdlet to retrieve a list of available disks.
3. In the command output, note the **Number** corresponding to the disk that you're making available.
3. Create a script file to execute DiskPart commands:
 1. Open the Start menu, and select **File Explorer**.
 2. Navigate to a directory, such as C:\, to store the script file.
 3. Choose or right-click an empty space within the folder to open the dialog box, position the cursor over **New** to access the context menu, and then choose **Text Document**.
 4. Name the text file diskpart.txt.
4. Add the following commands to the script file. You may need to modify the disk number, partition type, volume label, and drive letter. The script performs the following actions by default:
 1. Selects disk 1 for modification.
 2. Configures the volume to use the master boot record (MBR) partition structure.
 3. Formats the volume as an NTFS volume.
 4. Sets the volume label.
 5. Assigns the volume a drive letter.

Warning

If you're mounting a volume that already has data on it, do not reformat the volume or you will delete the existing data.

```
select disk 1
attributes disk clear readonly
online disk noerr
convert mbri
create partition primary
format quick fs=ntfs label="volume_label"
assign letter="drive_letter"
```

For more information, see [DiskPart Syntax and Parameters](#).

5. Open a command prompt, navigate to the folder in which the script is located, and run the following command to make a volume available for use on the specified disk:

```
C:\> diskpart /s diskpart.txt
```

Disk Management utility

To make an EBS volume available to use with the Disk Management utility

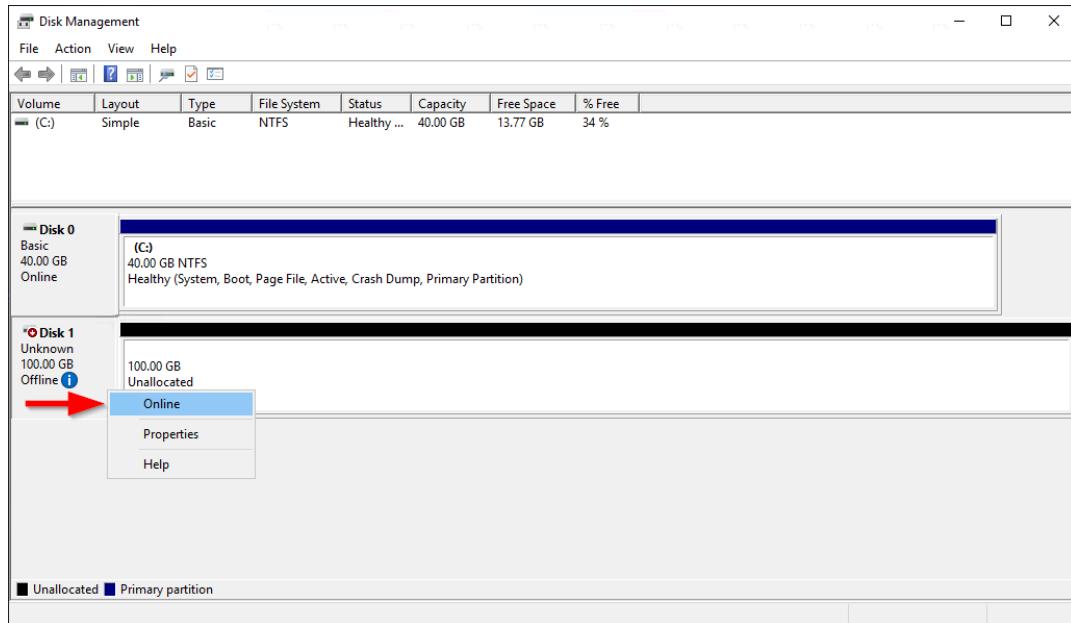

1. Log in to your Windows instance using Remote Desktop. For more information, see [Connect to your Windows instance \(p. 626\)](#).
2. Start the Disk Management utility. On the taskbar, open the context (right-click) menu for the Windows logo, and choose **Disk Management**.

Note

In Windows Server 2008, choose **Start**, **Administrative Tools**, **Computer Management**, **Disk Management**.

3. Bring the volume online. In the lower pane, open the context (right-click) menu for the left panel for the disk for the EBS volume. Choose **Online**.

Amazon Elastic Compute Cloud
User Guide for Windows Instances
EBS volumes

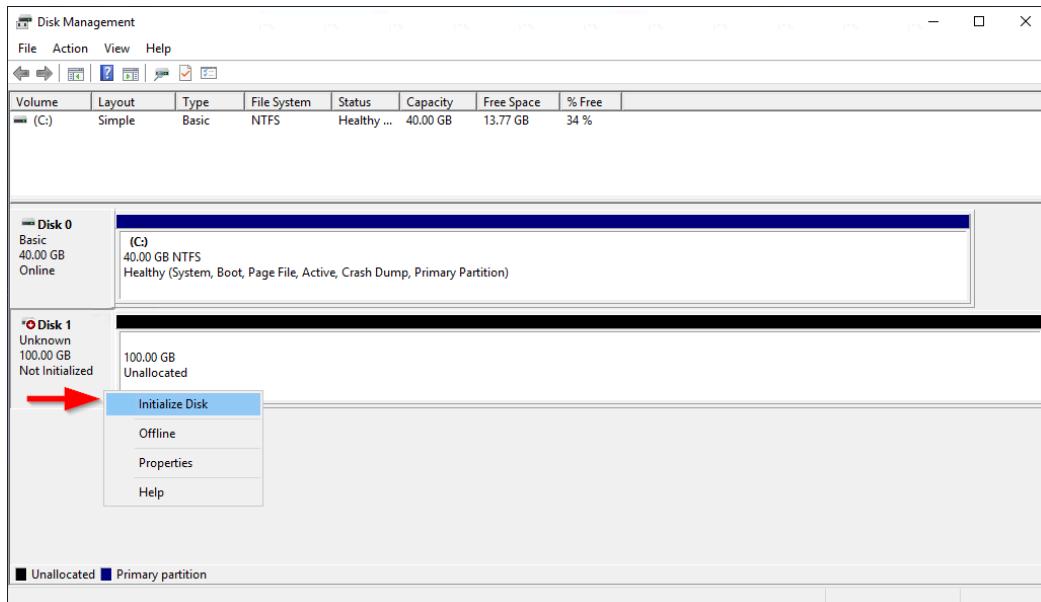

4. (Conditional) If the disk is not initialized, you must initialize it before you can use it. If the disk is already initialized, skip this step.

Warning

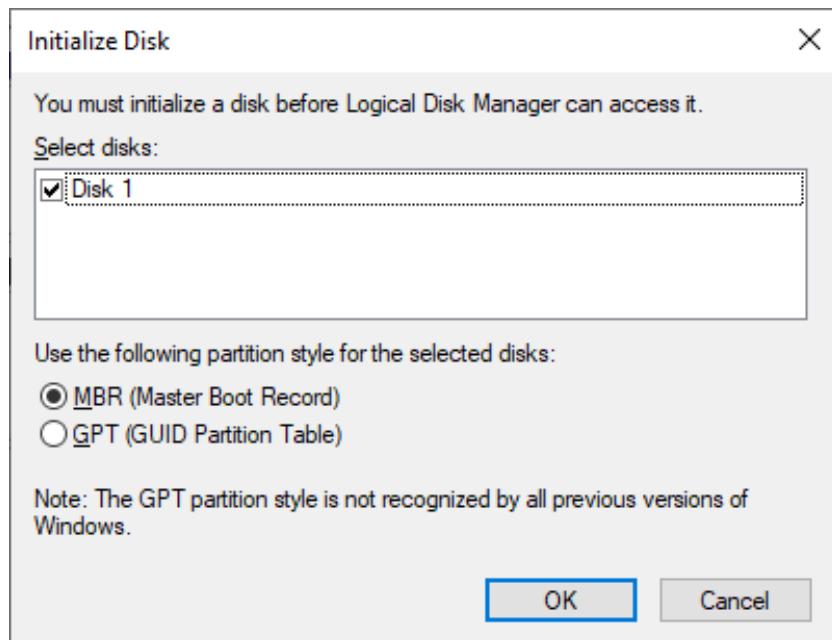

If you're mounting a volume that already has data on it (for example, a public data set, or a volume that you created from a snapshot), do not reformat the volume or you will delete the existing data.

If the disk is not initialized, initialize it as follows:

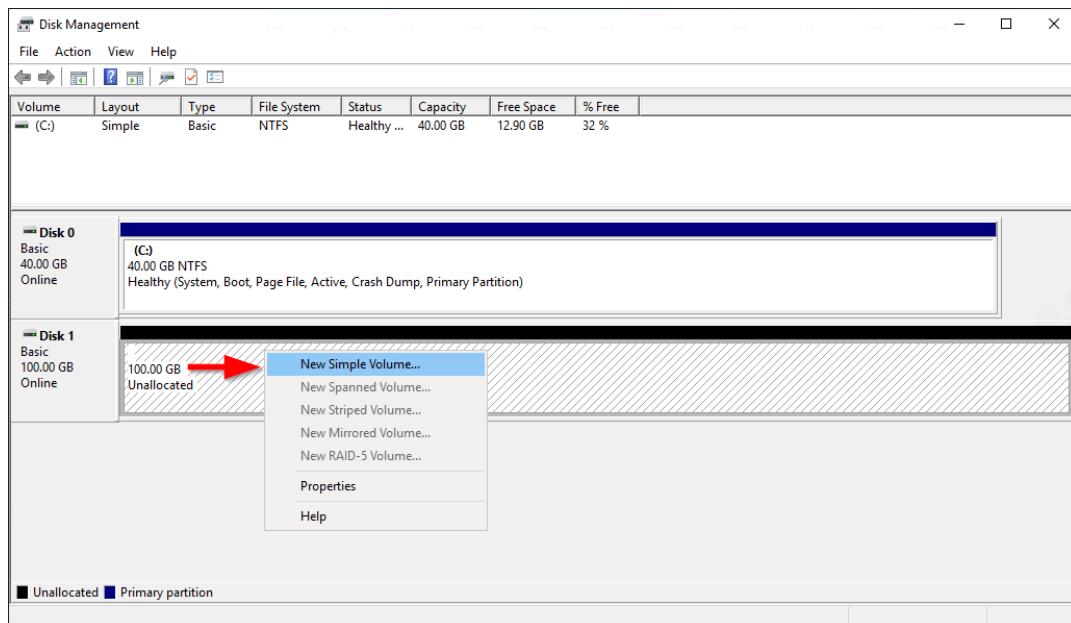

1. Open the context (right-click) menu for the left panel for the disk, and choose **Initialize Disk**.

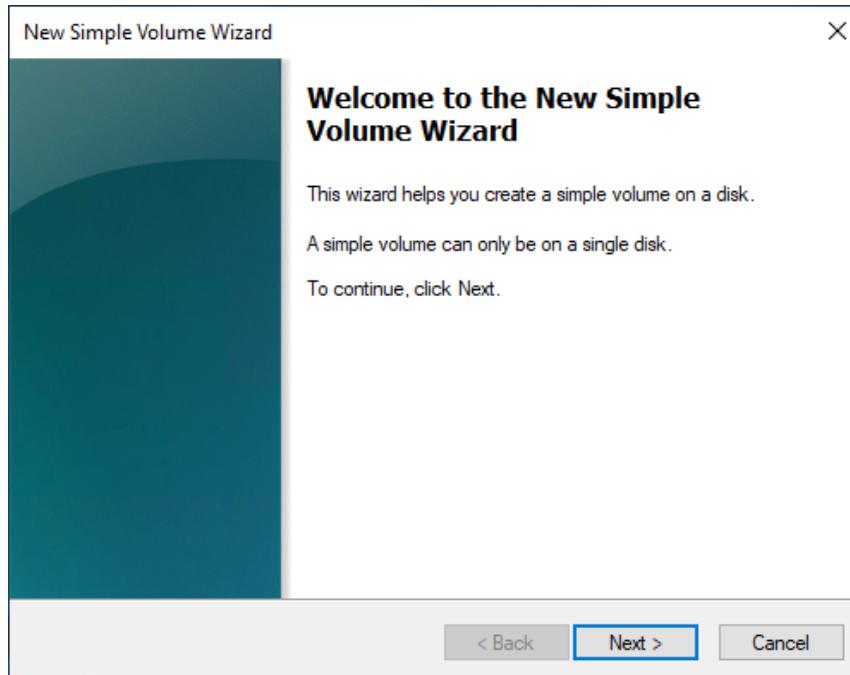

2. In the **Initialize Disk** dialog box, select a partition style, and choose **OK**.

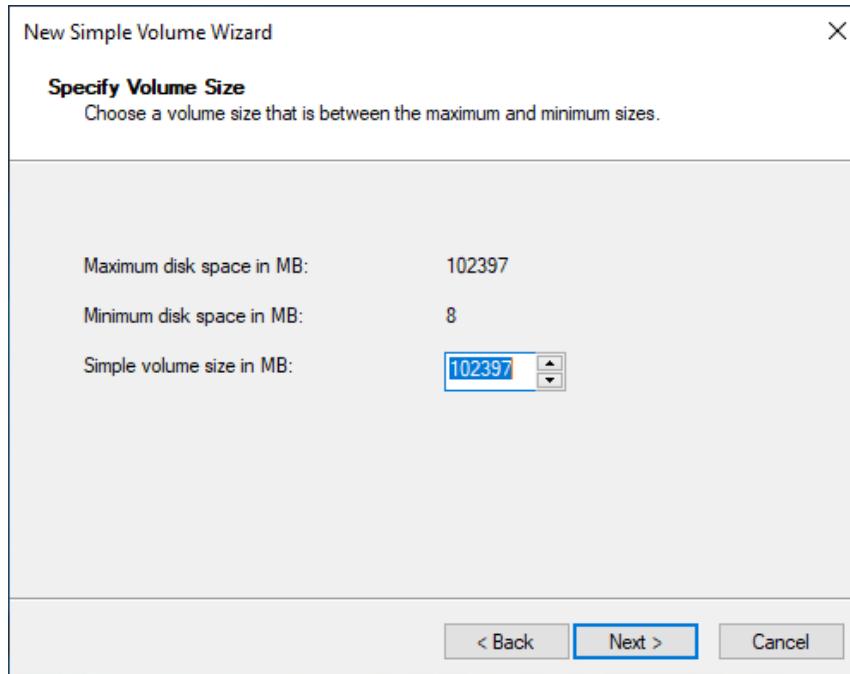

5. Open the context (right-click) menu for the right panel for the disk, and choose **New Simple Volume**.

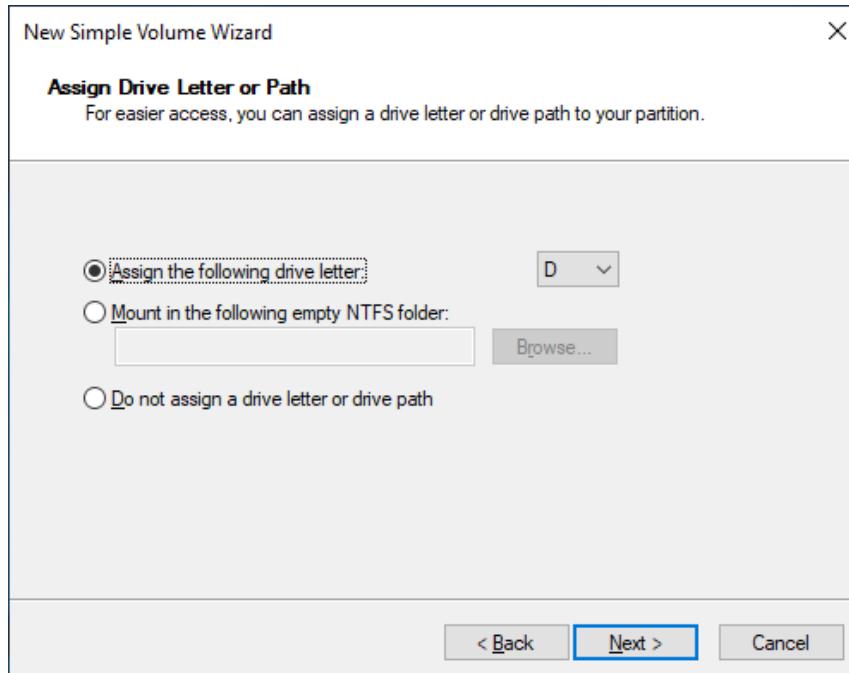

6. In the **New Simple Volume Wizard**, choose **Next**.

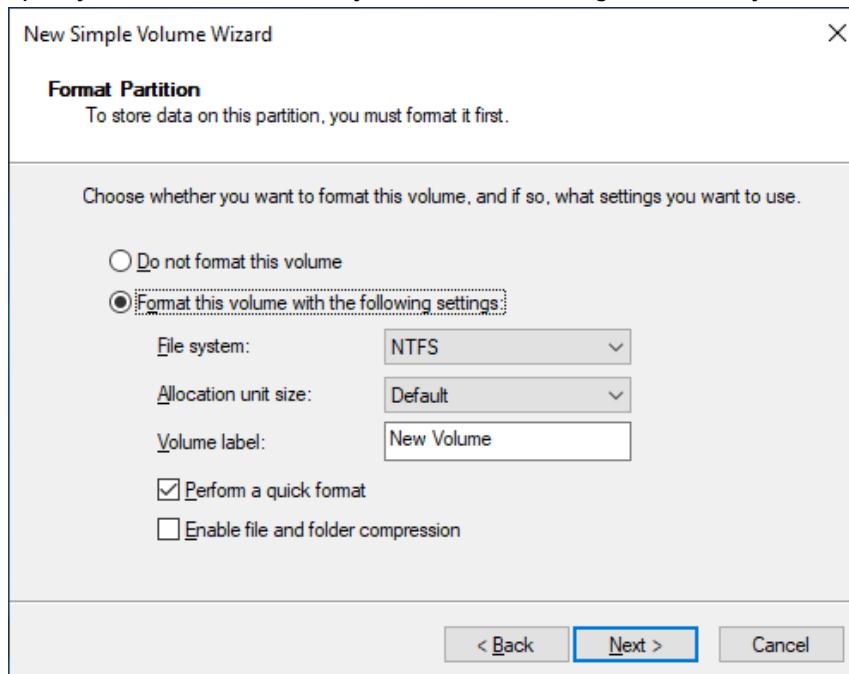

7. If you want to change the default maximum value, specify the **Simple volume size in MB**, and then choose **Next**.

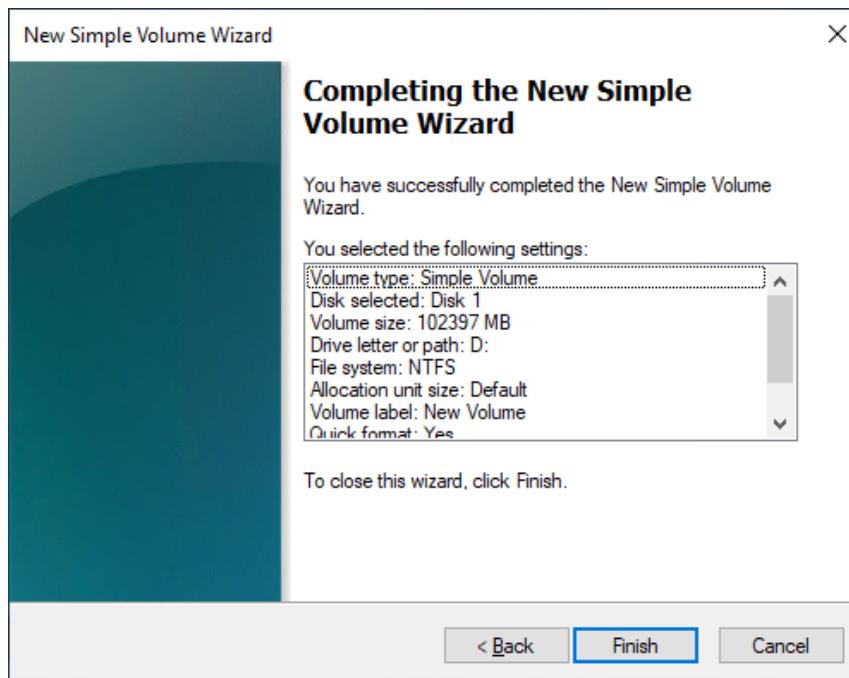

8. Specify a preferred drive letter, if necessary, within the **Assign the following drive letter** dropdown, and then choose **Next**.

9. Specify a **Volume Label** and adjust the default settings as necessary, and then choose **Next**.

10. Review your settings, and then choose **Finish** to apply the modifications and close the New Simple Volume wizard.

View information about an Amazon EBS volume

You can view descriptive information about your EBS volumes. For example, you can view information about all volumes in a specific Region or view detailed information about a single volume, including its size, volume type, whether the volume is encrypted, which master key was used to encrypt the volume, and the specific instance to which the volume is attached.

You can get additional information about your EBS volumes, such as how much disk space is available, from the operating system on the instance.

View volume information

You can view information about a volume using one of the following methods.

Console

To view information about a volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. To reduce the list, you can filter your volumes using tags and volume attributes. Choose the filter field, select a tag or volume attribute, and then select the filter value.
4. To view more information about a volume, choose its ID.

To view the EBS volumes that are attached to an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Storage** tab, the **Block devices** section lists the volumes that are attached to the instance. To view information about a specific volume, choose its ID in the **Volume ID** column.

AWS CLI

To view information about an EBS volume using the command line

You can use one of the following commands to view volume attributes. For more information, see [Access Amazon EC2 \(p. 5\)](#).

- [describe-volumes](#) (AWS CLI)
- [Get-EC2Volume](#) (AWS Tools for Windows PowerShell)

Amazon EC2 Global View

You can use Amazon EC2 Global View to view your volumes across all Regions for which your AWS account is enabled. For more information, see [List and filter resources across Regions using Amazon EC2 Global View \(p. 2083\)](#).

Volume state

Volume state describes the availability of an Amazon EBS volume. You can view the volume state in the **State** column on the **Volumes** page in the console, or by using the [describe-volumes](#) AWS CLI command.

The possible volume states are:

creating

The volume is being created.

available

The volume is not attached to an instance.

in-use

The volume is attached to an instance.

deleting

The volume is being deleted.

deleted

The volume is deleted.

error

The underlying hardware related to your EBS volume has failed, and the data associated with the volume is unrecoverable. For information about how to restore the volume or recover the data on the volume, see [My EBS volume has a status of "error"](#).

View volume metrics

You can get additional information about your EBS volumes from Amazon CloudWatch. For more information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1979\)](#).

View free disk space

You can get additional information about your EBS volumes, such as how much disk space is available, from the Windows operating system on the instance. For example, you can view the free disk space by opening File Explorer and selecting **This PC**.

You can also view the free disk space using the following `dir` command and examining the last line of the output:

```
C:\> dir C:  
Volume in drive C has no label.  
Volume Serial Number is 68C3-8081  
  
Directory of C:\  
  
03/25/2018  02:10 AM    <DIR>          .  
03/25/2018  02:10 AM    <DIR>          ..  
03/25/2018  03:47 AM    <DIR>          Contacts  
03/25/2018  03:47 AM    <DIR>          Desktop  
03/25/2018  03:47 AM    <DIR>          Documents  
03/25/2018  03:47 AM    <DIR>          Downloads  
03/25/2018  03:47 AM    <DIR>          Favorites  
03/25/2018  03:47 AM    <DIR>          Links  
03/25/2018  03:47 AM    <DIR>          Music  
03/25/2018  03:47 AM    <DIR>          Pictures  
03/25/2018  03:47 AM    <DIR>          Saved Games  
03/25/2018  03:47 AM    <DIR>          Searches  
03/25/2018  03:47 AM    <DIR>          Videos  
               0 File(s)           0 bytes  
            13 Dir(s)   18,113,662,976 bytes free
```

You can also view the free disk space using the following `fsutil` command:

```
C:\> fsutil volume diskfree C:  
Total # of free bytes      : 18113204224  
Total # of bytes           : 32210153472  
Total # of avail free bytes : 18113204224
```

Tip

You can also use the CloudWatch agent to collect disk space usage metrics from an Amazon EC2 instance without connecting to the instance. For more information, see [Create the CloudWatch agent configuration file](#) and [Installing the CloudWatch agent](#) in the *Amazon CloudWatch User Guide*. If you need to monitor disk space usage for multiple instances, you can install and configure the CloudWatch agent on those instances using Systems Manager. For more information, see [Installing the CloudWatch agent using Systems Manager](#).

For information about viewing free disk space on a Linux instance, see [View free disk space](#) in the *Amazon EC2 User Guide for Linux Instances*.

Replace a volume using a previous snapshot

Amazon EBS snapshots are the preferred backup tool on Amazon EC2 because of their speed, convenience, and cost. When creating a volume from a snapshot, you recreate its state at a specific point in time with the data saved up to that specific point intact. By attaching a volume created from a snapshot to an instance, you can duplicate data across Regions, create test environments, replace a damaged or corrupted production volume in its entirety, or retrieve specific files and directories and transfer them to another attached volume. For more information, see [Amazon EBS snapshots \(p. 1757\)](#).

You can use one of the following procedure to replace an Amazon EBS volume with another volume created from a previous snapshot of that volume. You must detach the current volume and then attach the new volume.

Note

Amazon EBS volumes can only be attached to instances in the same Availability Zone.

Console

To replace a volume

1. Create a volume from the snapshot and write down the ID of the new volume. For more information, see [Create a volume from a snapshot \(p. 1728\)](#).
2. On the Instances page, select the instance on which to replace the volume and write down the instance ID.

With the instance still selected, choose the **Storage** tab. In the **Block devices** section, find the volume to replace and write down the device name for the volume, for example /dev/sda1.

Choose the volume ID.

3. On the Volumes screen, select the volume and choose **Actions, Detach volume, Detach**.
4. Select the new volume that you created in step 1 and choose **Actions, Attach volume**.

For **Instance** and **Device name**, enter the instance ID and device name that you wrote down in Step 2, and then choose **Attach volume**.

5. Connect to your instance and mount the volume. For more information, see [Make an Amazon EBS volume available for use on Windows \(p. 1731\)](#).

Replace a root volume

Amazon EC2 enables you to replace the root Amazon EBS volume for a **running** instance while retaining the following:

- Data stored on instance store volumes — Instance store volumes remain attached to the instance after the root volume has been restored.
- Data stored on data (non-root) Amazon EBS volumes — Non-root Amazon EBS volumes remain attached to the instance after the root volume has been restored.
- Network configuration — All network interfaces remain attached to the instance and they retain their IP addresses, identifiers, and attachment IDs. When the instance becomes available, all pending network traffic is flushed. Additionally, the instance remains on the same physical host, so it retains its public and private IP addresses and DNS name.
- IAM policies — IAM profiles and policies (such as tag-based policies) that are associated with the instance are retained and enforced.

Topics

- [How does it work? \(p. 1740\)](#)
- [Replace a root volume \(p. 1744\)](#)
- [View root volume replacement tasks \(p. 1745\)](#)

How does it work?

When you replace the root volume for an instance, a new (replacement) root volume is restored in one of the following ways:

- **To the initial launch state** — the volume is restored to its initial state at instance launch. For more information, see [Restore a root volume to its launch state \(p. 1742\)](#).
- **From a snapshot** from the same lineage as the current root volume — this allows you to fix issues, such as root volume corruption or guest operating system network configuration errors. For more information, see [Replace a root volume using a snapshot \(p. 1743\)](#).

- **From an AMI** that has the same key attributes as the instance — this allows you to perform operating system and application patching or upgrades. For more information, see [Replace a root volume using an AMI \(p. 1743\)](#).

The original root volume is detached from the instance, and the new root volume is attached to the instance in its place. The instance's block device mapping is updated to reflect the ID of the replacement root volume. You can choose whether or not to keep the original root volume after the root volume replacement process has completed. If you choose delete the original root volume after the replacement process completes, the original root volume is automatically deleted and becomes unrecoverable. If you choose to keep the original root volume after the process completes, the volume remains provisioned in your account; you must manually delete it when you no longer need it.

If the root volume replacement task fails, the instance is rebooted and the original root volume remains attached to the instance.

Considerations for root volume replacement

- The instance must be in the `running` state.
- The instance is automatically rebooted during the process. The contents of the memory (RAM) is erased during the reboot. No manual reboots are required.
- You can't replace the root volume if it is an instance store volume. Only instances with Amazon EBS root volumes are supported.
- You can replace the root volume for all virtualized instance types and EC2 Mac bare metal instances. All other bare metal instance types are not supported.
- Amazon EC2 Mac bare metal instances support restoring a root volume to its launch state and replacing a root volume using a snapshot. Amazon EC2 Mac bare metal instances do not currently support replacing a root volume using an AMI.
- You can use any snapshot that belongs to the same lineage as any of the instance's previous root volumes.
- If your account is enabled for [Amazon EBS encryption by default \(p. 1921\)](#) in the current Region, the replacement root volume created by the root volume replacement task is always encrypted, regardless of the encryption status of the specified snapshot or the root volume of the specified AMI.
- The following table summarizes the possible encryption outcomes.

	Original root volume	Specified snapshot or AMI	Encryption by default	Replacement root volume	Encryption key used for replacement root volume
Restore replacement root volume to initial launch state	Encrypted	Not applicable	Not considered	Encrypted	Same KMS key as original root volume
	Unencrypted	Not applicable	Disabled	Unencrypted	Not applicable
	Unencrypted	Not applicable	Enabled	Encrypted	Account's default KMS key for Amazon EBS encryption (p. 1924)
Restore replacement root volume	Encrypted	Unencrypted	Not considered	Encrypted	Same KMS key as original root volume

	Original root volume	Specified snapshot or AMI	Encryption by default	Replacement root volume	Encryption key used for replacement root volume
from snapshot or AMI	Encrypted	Encrypted	Not considered	Encrypted	Same KMS key as original root volume
	Unencrypted	Unencrypted	Disabled	Unencrypted	Not applicable
	Unencrypted	Unencrypted	Enabled	Encrypted	Account's default KMS key for Amazon EBS encryption (p. 1924)
	Unencrypted	Encrypted	Not considered	Encrypted	If the AMI or snapshot is owned by the account, the replacement volume is encrypted with the AMI or snapshot's KMS key. If AMI or snapshot is shared with the account, replacement volume is encrypted with the account's default KMS key for Amazon EBS encryption (p. 1924) .

Topics

- [Restore a root volume to its launch state \(p. 1742\)](#)
- [Replace a root volume using a snapshot \(p. 1743\)](#)
- [Replace a root volume using an AMI \(p. 1743\)](#)

Restore a root volume to its launch state

You can perform a root volume replacement that replaces an instance's root volume with a replacement root volume that is restored to the original root volume's launch state. The replacement volume is automatically restored from the snapshot that was used to create the original volume during the instance launch.

The replacement root volume gets the same type, size, and delete on termination attributes as the original root volume.

Replace a root volume using a snapshot

You can perform a root volume replacement that replaces an instance's root volume with a replacement volume that is restored to a specific snapshot. This enables you to restore the root volume for an instance to a specific snapshot that you previously created from that root volume.

The replacement root volume gets the same type, size, and delete on termination attributes as the original root volume.

Considerations for using a snapshot

- You can only use snapshots that belong to the same lineage as the instance's current root volume.
- You can't use snapshot copies created from snapshots that were taken from the root volume.
- After successfully replacing the root volume, snapshots taken from the original root volume can still be used to replace the new (replacement) root volume.

Replace a root volume using an AMI

You can perform a root volume replacement using an AMI that you own or an AMI that is shared with you. The AMI must have the same product code, billing information, architecture type, and virtualization type as that of the instance.

If the instance is enabled for NitroTPM, ENA, or sriov-net, then you must use an AMI that supports those features. If the instance is not enabled for NitroTPM, ENA, or sriov-net, then you can select an AMI that does not support those features, or you can select an AMI that does support them, in which case support is added to the instance.

You can select an AMI with a different boot mode than that of the instance, as long as the instance supports the boot mode of the AMI. If the instance does not support the boot mode, the request fails. If the instance supports the boot mode, the new boot mode is propagated to the instance and its UEFI data is updated accordingly. If you manually modified the boot order or added a private UEFI Secure Boot key to load private kernel modules, the changes are lost during root volume replacement.

The replacement root volume gets the same volume type and delete on termination attribute as the original root volume, and it gets the size of the AMI root volume block device mapping.

Note

The size of the AMI root volume block device mapping must be equal to or greater than the size of the original root volume. If the size of the AMI root volume block device mapping is smaller than the size of the original root volume, the request fails.

After the root volume replacement task completes, the following new and updated information is reflected when you describe the instance using the console, AWS CLI or AWS SDKs:

- New AMI ID
- New volume ID for the root volume
- Updated boot mode configuration (if changed by the AMI)
- Updated NitroTPM configuration (if enabled by the AMI)
- Updated ENA configuration (if enabled by the AMI)
- Updated sriov-net configuration (if enabled by the AMI)

The new AMI ID is also reflected in the instance metadata.

Considerations for using an AMI:

- If you use an AMI that has multiple block device mappings, only the root volume of the AMI is used. The other (non-root) volumes are ignored.

- You can only use this feature if you have permissions to the AMI and its associated root volume snapshot. You cannot use this feature with AWS Marketplace AMIs.
- You can only use an AMI without a product code only if the instance does not have a product code.
- The size of the AMI root volume block device mapping must be equal to or greater than the size of the original root volume. If the size of the AMI root volume block device mapping is smaller than the size of the original root volume, the request fails.
- The instance identity documents for the instance are automatically updated.
- If the instance supports NitroTPM, the NitroTPM data for the instance is reset and new keys are generated.

Replace a root volume

When you replace the root volume for an instance, a *root volume replacement task* is created. You can use the root volume replacement task to monitor the progress and outcome of the replacement process. For more information, see [View root volume replacement tasks \(p. 1745\)](#).

You can replace the root volume for an instance using one of the following methods.

Note

If you use the Amazon EC2 console, the functionality is available in the new console only.

New console

To replace the root volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance for which to replace the root volume and choose **Actions, Monitor and troubleshoot, Replace root volume**.

Note

The **Replace root volume** action is disabled if the selected instance is not in the running state.

4. In the **Replace root volume** screen, do one of the following:
 - To restore the replacement root volume to its initial launch state, choose **Create replacement task** without selecting a snapshot.
 - To restore the replacement root volume to a specific snapshot, for **Snapshot**, select the snapshot to use, and then choose **Create replacement task**.
 - To restore the replacement root volume using an AMI, for **AMI**, select the AMI to use, and then choose **Create replacement task**.
5. To delete the original root volume after the replacement task completes, select **Delete replaced root volume**.

AWS CLI

To restore the replacement root volume to the launch state

Use the [create-replace-root-volume-task](#) command. For **--instance-id**, specify the ID of the instance for which to replace the root volume. Omit the **--snapshot-id --image-id** parameters. To delete the original root volume after it has been replaced, include **--delete-replaced-root-volume** and specify **true**.

```
$ aws ec2 create-replace-root-volume-task --instance-id instance_id --delete-replaced-root-volume true
```

For example:

```
$ aws ec2 create-replace-root-volume-task --instance-id i-1234567890abcdef0 --delete-replaced-root-volume true
```

To restore the replacement root volume to a specific snapshot

Use the [create-replace-root-volume-task](#) command. For `--instance-id`, specify the ID of the instance for which to replace the root volume. For `--snapshot-id`, specify the ID of the snapshot to use. To delete the original root volume after it has been replaced, include `--delete-replaced-root-volume` and specify `true`.

```
$ aws ec2 create-replace-root-volume-task --instance-id instance_id --snapshot-id snapshot_id --delete-replaced-root-volume true
```

For example:

```
$ aws ec2 create-replace-root-volume-task --instance-id i-1234567890abcdef0 --snapshot-id snap-9876543210abcdef0 --delete-replaced-root-volume true
```

To restore the replacement root volume using an AMI

Use the [create-replace-root-volume-task](#) command. For `--instance-id`, specify the ID of the instance for which to replace the root volume. For `--image-id`, specify the ID of the AMI to use. To delete the original root volume after it has been replaced, include `--delete-replaced-root-volume` and specify `true`.

```
$ aws ec2 create-replace-root-volume-task --instance-id instance_id --image-id ami_id --delete-replaced-root-volume true
```

For example:

```
$ aws ec2 create-replace-root-volume-task --instance-id i-01234567890abcdef --image-id ami-09876543210abcdef --delete-replaced-root-volume true
```

View root volume replacement tasks

When you replace the root volume for an instance, a *root volume replacement task* is created. The root volume replacement task transitions through the following states during the process:

- **pending** — the replacement volume is being created.
- **in-progress** — the original volume is being detached and the replacement volume is being attached.
- **succeeded** — the replacement volume has been successfully attached to the instance and the instance is available.
- **failing** — the replacement task is in the process of failing.
- **failed** — the replacement task has failed, but the original root volume is still attached.
- **failing-detached** — the replacement task is in the process of failing and the instance might not have a root volume attached.
- **failed-detached** — the replacement task has failed and the instance doesn't have a root volume attached.

You can view the root volume replacement tasks for an instance using one of the following methods.

Note

If you use the Amazon EC2 console, the functionality is available in the new console only.

Console

To view the root volume replacement tasks

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance for which to view the root volume replacement tasks, and then choose the **Storage** tab.
4. In the **Storage** tab, expand **Recent root volume replacement tasks**.

AWS CLI

To view the status of a root volume replacement task

Use the [describe-replace-root-volume-tasks](#) command and specify the IDs of the root volume replacement tasks to view.

```
$ aws ec2 describe-replace-root-volume-tasks --replace-root-volume-task-ids task_id_1 task_id_2
```

For example:

```
$ aws ec2 describe-replace-root-volume-tasks --replace-root-volume-task-ids replacevol-1234567890abcdef0
```

```
{  
    "ReplaceRootVolumeTasks": [  
        {  
            "ReplaceRootVolumeTaskId": "replacevol-1234567890abcdef0",  
            "InstanceId": "i-1234567890abcdef0",  
            "TaskState": "succeeded",  
            "StartTime": "2020-11-06 13:09:54.0",  
            "CompleteTime": "2020-11-06 13:10:14.0",  
            "SnapshotId": "snap-01234567890abcdef",  
            "DeleteReplacedRootVolume": "True"  
        }]  
    ]  
}
```

Alternatively, specify the `instance-id` filter to filter the results by instance.

```
$ aws ec2 describe-replace-root-volume-tasks --filters Name=instance-id,Values=instance_id
```

For example:

```
$ aws ec2 describe-replace-root-volume-tasks --filters Name=instance-id,Values=i-1234567890abcdef0
```

Monitor the status of your volumes

Amazon Web Services (AWS) automatically provides data that you can use to monitor your Amazon Elastic Block Store (Amazon EBS) volumes.

Contents

- [EBS volume status checks \(p. 1747\)](#)
- [EBS volume events \(p. 1749\)](#)
- [Work with an impaired volume \(p. 1750\)](#)
- [Work with the Auto-Enabled IO volume attribute \(p. 1751\)](#)

For additional monitoring information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1979\)](#) and [EventBridge for Amazon EBS \(p. 1985\)](#).

EBS volume status checks

Volume status checks enable you to better understand, track, and manage potential inconsistencies in the data on an Amazon EBS volume. They are designed to provide you with the information that you need to determine whether your Amazon EBS volumes are impaired, and to help you control how a potentially inconsistent volume is handled.

Volume status checks are automated tests that run every 5 minutes and return a pass or fail status. If all checks pass, the status of the volume is `ok`. If a check fails, the status of the volume is `impaired`. If the status is `insufficient-data`, the checks may still be in progress on the volume. You can view the results of volume status checks to identify any impaired volumes and take any necessary actions.

When Amazon EBS determines that a volume's data is potentially inconsistent, the default is that it disables I/O to the volume from any attached EC2 instances, which helps to prevent data corruption. After I/O is disabled, the next volume status check fails, and the volume status is `impaired`. In addition, you'll see an event that lets you know that I/O is disabled, and that you can resolve the impaired status of the volume by enabling I/O to the volume. We wait until you enable I/O to give you the opportunity to decide whether to continue to let your instances use the volume, or to run a consistency check using a command, such as `chkdsk`, before doing so.

Note

Volume status is based on the volume status checks, and does not reflect the volume state. Therefore, volume status does not indicate volumes in the `error` state (for example, when a volume is incapable of accepting I/O.) For information about volume states, see [Volume state \(p. 1738\)](#).

If the consistency of a particular volume is not a concern, and you'd prefer that the volume be made available immediately if it's impaired, you can override the default behavior by configuring the volume to automatically enable I/O. If you enable the **Auto-Enable IO** volume attribute (`autoEnableIO` in the API), the volume status check continues to pass. In addition, you'll see an event that lets you know that the volume was determined to be potentially inconsistent, but that its I/O was automatically enabled. This enables you to check the volume's consistency or replace it at a later time.

The I/O performance status check compares actual volume performance to the expected performance of a volume. It alerts you if the volume is performing below expectations. This status check is available only for Provisioned IOPS SSD (`io1` and `io2`) and General Purpose SSD (`gp3`) volumes that are attached to an instance. The status check is not valid for General Purpose SSD (`gp2`), Throughput Optimized HDD (`st1`), Cold HDD (`sc1`), or Magnetic(`standard`) volumes. The I/O performance status check is performed once every minute, and CloudWatch collects this data every 5 minutes. It might take up to 5 minutes from the moment that you attach an `io1` or `io2` volume to an instance for the status check to report the I/O performance status.

Important

While initializing Provisioned IOPS SSD volumes that were restored from snapshots, the performance of the volume may drop below 50 percent of its expected level, which causes the volume to display a warning state in the **I/O Performance** status check. This is expected, and you can ignore the warning state on Provisioned IOPS SSD volumes while you are initializing them. For more information, see [Initialize Amazon EBS volumes \(p. 1970\)](#).

The following table lists statuses for Amazon EBS volumes.

Volume status	I/O enabled status	I/O performance status (io1, io2, and gp3 volumes only)
ok	Enabled (I/O Enabled or I/O Auto-Enabled)	Normal (Volume performance is as expected)
warning	Enabled (I/O Enabled or I/O Auto-Enabled)	Degraded (Volume performance is below expectations) Severely Degraded (Volume performance is well below expectations)
impaired	Enabled (I/O Enabled or I/O Auto-Enabled) Disabled (Volume is offline and pending recovery, or is waiting for the user to enable I/O)	Stalled (Volume performance is severely impacted) Not Available (Unable to determine I/O performance because I/O is disabled)
insufficient-data	Enabled (I/O Enabled or I/O Auto-Enabled) Insufficient Data	Insufficient Data

You can view and work with status checks using the following methods.

Console

To view status checks

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.

The **Volume status** column displays the operational status of each volume.

3. To view the status details of a specific volume, select it in the grid and choose the **Status checks** tab.
4. If you have a volume with a failed status check (status is **impaired**), see [Work with an impaired volume \(p. 1750\)](#).

Alternatively, you can choose **Events** in the navigator to view all the events for your instances and volumes. For more information, see [EBS volume events \(p. 1749\)](#).

AWS CLI

To view volume status information

Use one of the following commands.

- [describe-volume-status](#) (AWS CLI)
- [Get-EC2VolumeStatus](#) (AWS Tools for Windows PowerShell)

For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

EBS volume events

When Amazon EBS determines that a volume's data is potentially inconsistent, it disables I/O to the volume from any attached EC2 instances by default. This causes the volume status check to fail, and creates a volume status event that indicates the cause of the failure.

To automatically enable I/O on a volume with potential data inconsistencies, change the setting of the **Auto-Enabled IO** volume attribute (autoEnableIO in the API). For more information about changing this attribute, see [Work with an impaired volume \(p. 1750\)](#).

Each event includes a start time that indicates the time at which the event occurred, and a duration that indicates how long I/O for the volume was disabled. The end time is added to the event when I/O for the volume is enabled.

Volume status events include one of the following descriptions:

Awaiting Action: Enable IO

Volume data is potentially inconsistent. I/O is disabled for the volume until you explicitly enable it. The event description changes to **IO Enabled** after you explicitly enable I/O.

IO Enabled

I/O operations were explicitly enabled for this volume.

IO Auto-Enabled

I/O operations were automatically enabled on this volume after an event occurred. We recommend that you check for data inconsistencies before continuing to use the data.

Normal

For io1, io2, and gp3 volumes only. Volume performance is as expected.

Degraded

For io1, io2, and gp3 volumes only. Volume performance is below expectations.

Severely Degraded

For io1, io2, and gp3 volumes only. Volume performance is well below expectations.

Stalled

For io1, io2, and gp3 volumes only. Volume performance is severely impacted.

You can view events for your volumes using the following methods.

Console

To view events for your volumes

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**. All instances and volumes that have events are listed.
3. You can filter by volume to view only volume status. You can also filter on specific status types.
4. Select a volume to view its specific event.

AWS CLI

To view events for your volumes

Use one of the following commands.

- [describe-volume-status \(AWS CLI\)](#)

- [Get-EC2VolumeStatus](#) (AWS Tools for Windows PowerShell)

For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

If you have a volume where I/O is disabled, see [Work with an impaired volume \(p. 1750\)](#). If you have a volume where I/O performance is below normal, this might be a temporary condition due to an action you have taken (for example, creating a snapshot of a volume during peak usage, running the volume on an instance that cannot support the I/O bandwidth required, accessing data on the volume for the first time, etc.).

Work with an impaired volume

Use the following options if a volume is impaired because the volume's data is potentially inconsistent.

Options

- [Option 1: Perform a consistency check on the volume attached to its instance \(p. 1750\)](#)
- [Option 2: Perform a consistency check on the volume using another instance \(p. 1751\)](#)
- [Option 3: Delete the volume if you no longer need it \(p. 1751\)](#)

Option 1: Perform a consistency check on the volume attached to its instance

The simplest option is to enable I/O and then perform a data consistency check on the volume while the volume is still attached to its Amazon EC2 instance.

To perform a consistency check on an attached volume

1. Stop any applications from using the volume.
2. Enable I/O on the volume. Use one of the following methods.

Console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Select the volume on which to enable I/O operations.
4. Choose **Actions, Enable I/O**.

AWS CLI

To enable I/O for a volume with the command line

You can use one of the following commands to view event information for your Amazon EBS volumes. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [enable-volume-io](#) (AWS CLI)
- [Enable-EC2VolumeIO](#) (AWS Tools for Windows PowerShell)

3. Check the data on the volume.
 - a. Run the **chkdsk** command.
 - b. (Optional) Review any available application or system logs for relevant error messages.
 - c. If the volume has been impaired for more than 20 minutes, you can contact the AWS Support Center. Choose **Troubleshoot**, and then in the **Troubleshoot Status Checks** dialog box, choose **Contact Support** to submit a support case.

Option 2: Perform a consistency check on the volume using another instance

Use the following procedure to check the volume outside your production environment.

Important

This procedure may cause the loss of write I/Os that were suspended when volume I/O was disabled.

To perform a consistency check on a volume in isolation

1. Stop any applications from using the volume.
2. Detach the volume from the instance. For more information, see [Detach an Amazon EBS volume from a Windows instance \(p. 1752\)](#).
3. Enable I/O on the volume. Use one of the following methods.

Console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Select the volume that you detached in the previous step.
4. Choose **Actions, Enable I/O**.

AWS CLI

To enable I/O for a volume with the command line

You can use one of the following commands to view event information for your Amazon EBS volumes. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [enable-volume-io](#) (AWS CLI)
 - [Enable-EC2VolumeIO](#) (AWS Tools for Windows PowerShell)
4. Attach the volume to another instance. For more information, see [Launch your instance \(p. 551\)](#) and [Attach an Amazon EBS volume to an instance \(p. 1729\)](#).
 5. Check the data on the volume.
 - a. Run the **chkdsk** command.
 - b. (Optional) Review any available application or system logs for relevant error messages.
 - c. If the volume has been impaired for more than 20 minutes, you can contact the AWS Support Center. Choose **Troubleshoot**, and then in the troubleshooting dialog box, choose **Contact Support** to submit a support case.

Option 3: Delete the volume if you no longer need it

If you want to remove the volume from your environment, simply delete it. For information about deleting a volume, see [Delete an Amazon EBS volume \(p. 1755\)](#).

If you have a recent snapshot that backs up the data on the volume, you can create a new volume from the snapshot. For more information, see [Create a volume from a snapshot \(p. 1728\)](#).

Work with the Auto-Enabled IO volume attribute

When Amazon EBS determines that a volume's data is potentially inconsistent, it disables I/O to the volume from any attached EC2 instances by default. This causes the volume status check to fail, and creates a volume status event that indicates the cause of the failure. If the consistency of a particular volume is not a concern, and you prefer that the volume be made available immediately if it's **impaired**,

you can override the default behavior by configuring the volume to automatically enable I/O. If you enable the **Auto-Enabled IO** volume attribute (`autoEnableIO` in the API), I/O between the volume and the instance is automatically re-enabled and the volume's status check will pass. In addition, you'll see an event that lets you know that the volume was in a potentially inconsistent state, but that its I/O was automatically enabled. When this event occurs, you should check the volume's consistency and replace it if necessary. For more information, see [EBS volume events \(p. 1749\)](#).

You can view and modify the **Auto-Enabled IO** attribute of a volume using one of the following methods.

New console

To view the Auto-Enabled IO attribute of a volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose the **Status checks** tab.

The **Auto-enabled I/O** field displays the current setting (**Enabled** or **Disabled**) for the selected volume.

To modify the Auto-Enabled IO attribute of a volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Actions, Manage auto-enabled I/O**.
4. To automatically enable I/O for an impaired volume, select the **Auto-enable I/O for impaired volumes** check box. To disable the feature, clear the check box.
5. Choose **Update**.

AWS CLI

To view the `autoEnableIO` attribute of a volume

Use one of the following commands.

- [describe-volume-attribute](#) (AWS CLI)
- [Get-EC2VolumeAttribute](#) (AWS Tools for Windows PowerShell)

To modify the `autoEnableIO` attribute of a volume

Use one of the following commands.

- [modify-volume-attribute](#) (AWS CLI)
- [Edit-EC2VolumeAttribute](#) (AWS Tools for Windows PowerShell)

For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#)

Detach an Amazon EBS volume from a Windows instance

You need to detach an Amazon Elastic Block Store (Amazon EBS) volume from an instance before you can attach it to a different instance or delete it. Detaching a volume does not affect the data on the volume.

For information about detaching volumes from a Linux instance, see [Detach a volume from a Linux instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

Topics

- [Considerations \(p. 343\)](#)
- [Unmount and detach a volume \(p. 1753\)](#)
- [Troubleshoot \(p. 1754\)](#)

Considerations

- You can detach an Amazon EBS volume from an instance explicitly or by terminating the instance. However, if the instance is running, you must first unmount the volume from the instance.
- If an EBS volume is the root device of an instance, you must stop the instance before you can detach the volume.
- You can reattach a volume that you detached (without unmounting it), but it might not get the same mount point. If there were writes to the volume in progress when it was detached, the data on the volume might be out of sync.
- After you detach a volume, you are still charged for volume storage as long as the storage amount exceeds the limit of the AWS Free Tier. You must delete a volume to avoid incurring further charges. For more information, see [Delete an Amazon EBS volume \(p. 1755\)](#).

Unmount and detach a volume

Use the following procedures to unmount and detach a volume from an instance. This can be useful when you need to attach the volume to a different instance or when you need to delete the volume.

Steps

- [Step 1: Unmount the volume \(p. 1753\)](#)
- [Step 2: Detach the volume from the instance \(p. 1753\)](#)
- [Step 3: Uninstall the offline device locations \(p. 1754\)](#)

Step 1: Unmount the volume

From your Windows instance, unmount the volume as follows.

1. Start the Disk Management utility.
 - (Windows Server 2012 and later) On the taskbar, right-click the Windows logo and choose **Disk Management**.
 - Windows Server 2008) Choose **Start, Administrative Tools, Computer Management, Disk Management**.
2. Right-click the disk (for example, right-click **Disk 1**) and then choose **Offline**. Wait for the disk status to change to **Offline** before opening the Amazon EC2 console.

Step 2: Detach the volume from the instance

To detach the volume from the instance, use one of the following methods:

Console

To detach an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Volumes**.
3. Select the volume to detach and choose **Actions, Detach volume**.
4. When prompted for confirmation, choose **Detach**.

Command line

To detach an EBS volume from an instance using the command line

After unmounting the volume, you can use one of the following commands to detach it. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [detach-volume](#) (AWS CLI)
- [Dismount-EC2Volume](#) (AWS Tools for Windows PowerShell)

Step 3: Uninstall the offline device locations

When you unmount and detach a volume from an instance, Windows flags the device location as offline. The device location remains offline after rebooting, and stopping and restarting the instance. When you restart the instance, Windows might mount one of the remaining volumes to the offline device location. This causes the volume to be unavailable in Windows. To prevent this from happening and to ensure that all volumes are attached to online device locations the next time Windows starts, perform the following steps:

1. On the instance, open the Device Manager.
2. In the Device Manager, select **View, Show hidden devices**.
3. In the list of devices, expand the **Storage controllers** node.

The device locations to which the detached volumes were mounted are named AWS NVMe Elastic Block Storage Adapter and they should appear greyed out.

4. Right-click each greyed out device location named AWS NVMe Elastic Block Storage Adapter, select **Uninstall device** and choose **Uninstall**.

Important

Do not select the **Delete the driver software for this device** check box.

Troubleshoot

The following are common problems encountered when detaching volumes, and how to resolve them.

Note

To guard against the possibility of data loss, take a snapshot of your volume before attempting to unmount it. Forced detachment of a stuck volume can cause damage to the file system or the data it contains or an inability to attach a new volume using the same device name, unless you reboot the instance.

- If you encounter problems while detaching a volume through the Amazon EC2 console, it can be helpful to use the **describe-volumes** CLI command to diagnose the issue. For more information, see [describe-volumes](#).
- If your volume stays in the detaching state, you can force the detachment by choosing **Force Detach**. Use this option only as a last resort to detach a volume from a failed instance, or if you are detaching a volume with the intention of deleting it. The instance doesn't get an opportunity to flush file system caches or file system metadata. If you use this option, you must perform the file system check and repair procedures.

- If you've tried to force the volume to detach multiple times over several minutes and it stays in the detaching state, you can post a request for help to [AWS re:Post](#). To help expedite a resolution, include the volume ID and describe the steps that you've already taken.
- When you attempt to detach a volume that is still mounted, the volume can become stuck in the busy state while it is trying to detach. The following output from **describe-volumes** shows an example of this condition:

```
"Volumes": [  
    {  
        "AvailabilityZone": "us-west-2b",  
        "Attachments": [  
            {  
                "AttachTime": "2016-07-21T23:44:52.000Z",  
                "InstanceId": "i-fedc9876",  
                "VolumeId": "vol-1234abcd",  
                "State": "busy",  
                "DeleteOnTermination": false,  
                "Device": "/dev/sdf"  
            }  
            ...  
        ]  
    }  
]
```

When you encounter this state, detachment can be delayed indefinitely until you unmount the volume, force detachment, reboot the instance, or all three.

Delete an Amazon EBS volume

You can delete an Amazon EBS volume that you no longer need. After deletion, its data is gone and the volume can't be attached to any instance. So before deletion, you can store a snapshot of the volume, which you can use to re-create the volume later.

Note

You can't delete a volume if it's attached to an instance. To delete a volume, you must first detach it. For more information, see [Detach an Amazon EBS volume from a Windows instance \(p. 1752\)](#).

You can check if a volume is attached to an instance. In the console, on the **Volumes** page, you can view the state of your volumes.

- If a volume is attached to an instance, it's in the **in-use** state.
- If a volume is detached from an instance, it's in the **available** state. You can delete this volume.

You can delete an EBS volume using one of the following methods.

Console

To delete an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume to delete and choose **Actions, Delete volume**.

Note

If **Delete volume** is greyed out, the volume is attached to an instance. You must detach the volume from the instance before it can be deleted.

4. In the confirmation dialog box, choose **Delete**.

AWS CLI

To delete an EBS volume using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [delete-volume](#) (AWS CLI)
- [Remove-EC2Volume](#) (AWS Tools for Windows PowerShell)

Fault testing on Amazon EBS

Use AWS Fault Injection Simulator and the Pause I/O action to temporarily stop I/O between an Amazon EBS volume and the instances to which it is attached to test how your workloads handle I/O interruptions. With AWS FIS, you can use controlled experiments to test your architecture and monitoring, such as Amazon CloudWatch alarms and OS timeout configurations, and improve resiliency to storage faults.

For more information about AWS FIS, see the [AWS Fault Injection Simulator User Guide](#).

Considerations

Keep in mind the following considerations for pausing volume I/O:

- You can pause I/O for all Amazon EBS volume types that are attached to [instances built on the Nitro System \(p. 218\)](#).
- You can pause I/O for the root volume.
- You can pause I/O for Multi-Attach enabled volumes. If you pause I/O for a Multi-Attach enabled volume, I/O is paused between the volume and all of the instances to which it is attached.
- To test your OS timeout configuration, set the experiment duration equal to or greater than the value specified for `nvme_core.io_timeout`. For more information, see [I/O operation timeout \(p. 1941\)](#).
- If you drive I/O to a volume that has I/O paused, the following happens:
 - The volume's status transitions to `impaired` within 120 seconds. For more information, see [Monitor the status of your volumes \(p. 1746\)](#).
 - The CloudWatch metrics for queue length (`VolumeQueueLength`) will be non-zero. Any alarms or monitoring should monitor for a non-zero queue depth. For more information see [Volume metrics for volumes attached to all instance types \(p. 1980\)](#).
 - The CloudWatch metrics for `VolumeReadOps` or `VolumeWriteOps` will be `0`, which indicates that the volume is no longer processing I/O.

Limitations

Keep in mind the following limitations for pausing volume I/O:

- Instance store volumes are not supported.
- Xen-based instance types are not supported.
- You can't pause I/O for volumes created on an Outpost in AWS Outposts, in an AWS Wavelength Zone, or in a Local Zone.

You can perform a basic experiment from the Amazon EC2 console, or you can perform more advanced experiments using the AWS FIS console. For more information about performing advanced experiments using the AWS FIS console, see [Tutorials for AWS FIS](#) in the [AWS Fault Injection Simulator User Guide](#).

To perform a basic experiment using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume for which to pause I/O and choose **Actions, Fault injection, Pause volume I/O**.
4. For **Duration**, enter the duration for which to pause I/O between the volume and the instances. The field next to the Duration dropdown list shows the duration in ISO 8601 format.
5. In the **Service access** section, select the [IAM service role](#) for AWS FIS to assume to perform the experiment. You can use either the default role, or an existing role that you created. For more information, see [Create an IAM role for AWS FIS experiments](#).
6. Choose **Pause volume I/O**. When prompted, enter `start` in the confirmation field and choose **Start experiment**.
7. Monitor the progress and impact of your experiment. For more information, see [Monitoring AWS FIS](#) in the *AWS FIS User Guide*.

Amazon EBS snapshots

You can back up the data on your Amazon EBS volumes to Amazon S3 by taking point-in-time snapshots. Snapshots are *incremental* backups, which means that only the blocks on the device that have changed after your most recent snapshot are saved. This minimizes the time required to create the snapshot and saves on storage costs by not duplicating data.

Important

AWS does not automatically back up data stored on your Amazon EBS volumes. For data resiliency and disaster recovery, it remains your responsibility to create regular backups using Amazon EBS snapshots, or to set up automatic snapshot creation using [Amazon Data Lifecycle Manager \(p. 1859\)](#) or [AWS Backup](#).

Each snapshot contains all of the information that is needed to restore your data (from the moment when the snapshot was taken) to a new EBS volume. When you create an EBS volume based on a snapshot, the new volume begins as an exact replica of the original volume that was used to create the snapshot. The replicated volume loads data in the background so that you can begin using it immediately. If you access data that hasn't been loaded yet, the volume immediately downloads the requested data from Amazon S3, and then continues loading the rest of the volume's data in the background. For more information, see [Create Amazon EBS snapshots \(p. 1762\)](#).

When you delete a snapshot, only the data unique to that snapshot is removed. For more information, see [Delete an Amazon EBS snapshot \(p. 1779\)](#).

Snapshot events

You can track the status of your EBS snapshots through CloudWatch Events. For more information, see [EBS snapshot events \(p. 1989\)](#).

Application-consistent snapshots

Using Systems Manager Run Command, you can take application-consistent snapshots of all EBS volumes attached to your Amazon EC2 Windows instances. The snapshot process uses the Windows [Volume Shadow Copy Service \(VSS\)](#) to take image-level backups of VSS-aware applications, including data from pending transactions between these applications and the disk. You don't need to shut down your instances or disconnect them when you back up all attached volumes. For more information, see [Creating a VSS Application-Consistent Snapshot](#).

Multi-volume snapshots

Snapshots can be used to create a backup of critical workloads, such as a large database or a file system that spans across multiple EBS volumes. Multi-volume snapshots allow you to take exact point-in-time, data coordinated, and crash-consistent snapshots across multiple EBS volumes attached to an EC2 instance. You are no longer required to stop your instance or to coordinate between volumes to ensure crash consistency, because snapshots are automatically taken across multiple EBS volumes. For more information, see the steps for creating a multi-volume EBS snapshot under [Create Amazon EBS snapshots \(p. 1762\)](#).

Snapshot pricing

Charges for your snapshots are based on the amount of data stored. Because snapshots are incremental, deleting a snapshot might not reduce your data storage costs. Data referenced exclusively by a snapshot is removed when that snapshot is deleted, but data referenced by other snapshots is preserved. For more information, see [Amazon Elastic Block Store Volumes and Snapshots](#) in the *AWS Billing User Guide*.

- [Automate the snapshot lifecycle \(p. 1859\)](#)

How snapshots work

The first snapshot that you create from a volume is always a *full snapshot*. It includes all of the data blocks written to the volume at the time of creating the snapshot. Subsequent snapshots of the same volume are *incremental snapshots*. They include only changed and new data blocks written to the volume since the last snapshot was created.

The size of a full snapshot is determined by the size of the data being backed up, not the size of the source volume. Similarly, the storage costs associated with a full snapshot is determined by the size of the snapshot, not the size of the source volume. For example, you create the first snapshot of a 200 GiB Amazon EBS volume that contains only 50 GiB of data. This results in a full snapshot that is 50 GiB in size, and you are billed for 50 GiB snapshot storage.

Similarly, the size and storage costs of an incremental snapshot are determined by the size of any data that was written to the volume since the previous snapshot was created. Continuing this example, if you create a second snapshot of the 200 GiB volume after changing 20 GiB of data and adding 10 GiB of data, the incremental snapshot is 30 GiB in size. You are then billed for that additional 30 GiB snapshot storage.

For more information about snapshot pricing, see [Amazon EBS pricing](#).

Important

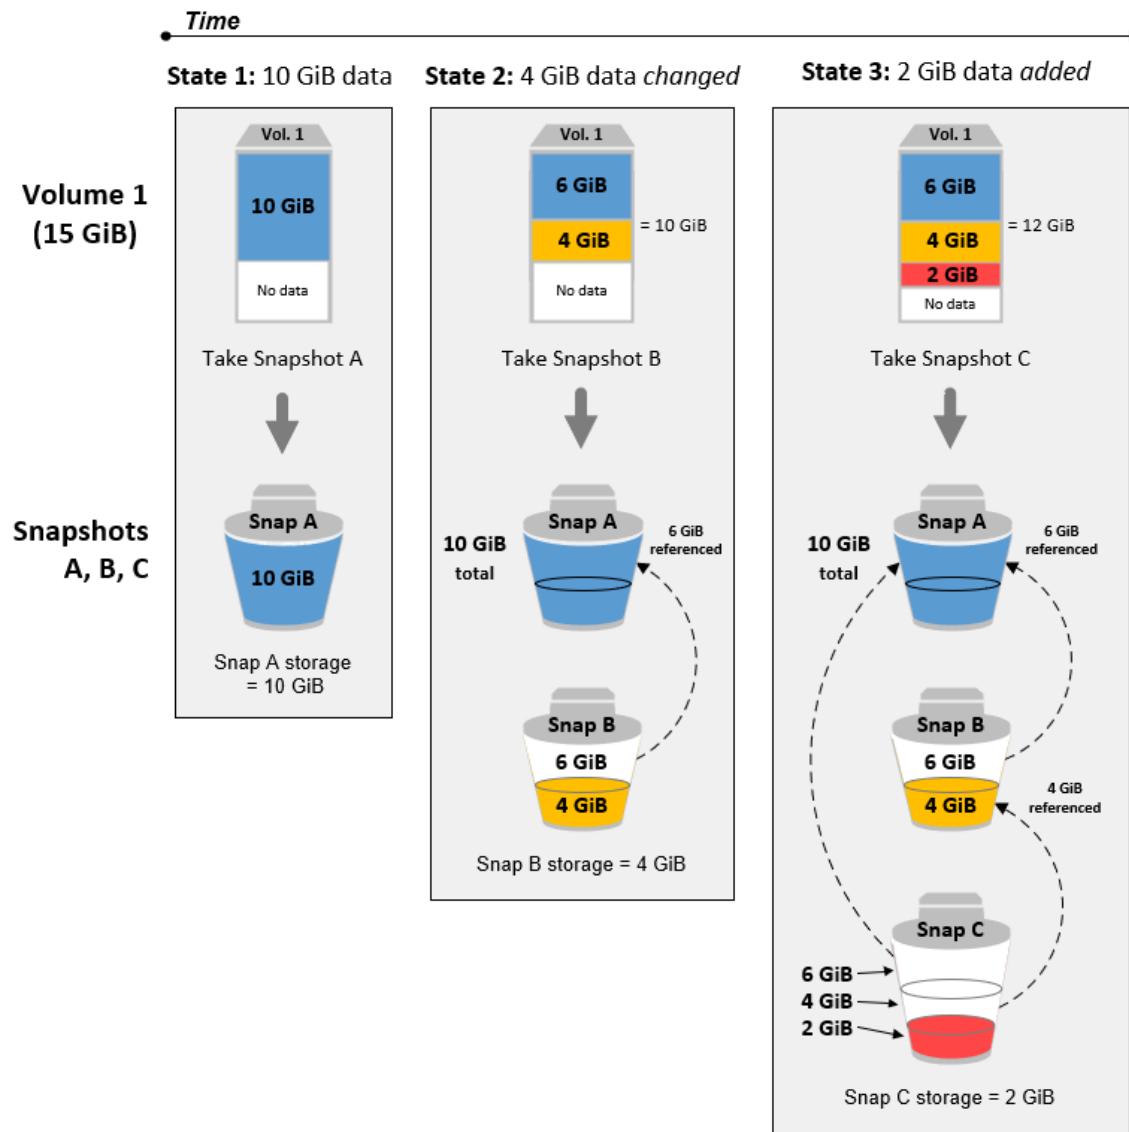

When you archive an incremental snapshot, it is converted to a full snapshot that includes all of the blocks written to the volume at the time that the snapshot was created. It is then moved to the Amazon EBS Snapshots Archive tier. Snapshots in the archive tier are billed at a different rate from snapshots in the standard tier. For more information, see [Pricing and billing \(p. 1787\)](#).

The following sections show how an EBS snapshot captures the state of a volume at a point in time, and how subsequent snapshots of a changing volume create a history of those changes.

Multiple snapshots of the same volume

The diagram in this section shows Volume 1, which is 15 GiB in size, at three points in time. A snapshot is taken of each of these three volume states. The diagram specifically shows the following:

- In **State 1**, the volume has 10 GiB of data. **Snap A** is the first snapshot taken of the volume. **Snap A** is a full snapshot and the entire 10 GiB of data is backed up.
- In **State 2**, the volume still contains 10 GiB of data, but only 4 GiB have changed after **Snap A** was taken. **Snap B** is an incremental snapshot. It needs to back up only the 4 GiB that changed. The other 6 GiB of unchanged data, which are already backed up in **Snap A**, are *referenced* by **Snap B** rather than being backed up again. This is indicated by the dashed arrow.
- In **State 3**, 2 GiB of data have been added to the volume, for a total of 12 GiB, after **Snap B** was taken. **Snap C** is an incremental snapshot. It needs to back up only the 2 GiB that were added after **Snap B** was taken. As shown by the dashed arrows, **Snap C** also references the 4 GiB of data stored in **Snap B**, and the 6 GiB of data stored in **Snap A**.
- The total storage required for the three snapshots is 16 GiB total. This accounts for 10 GiB for **Snap A**, 4 GiB for **Snap B**, and 2 GiB for **Snap C**.

Incremental snapshots of different volumes

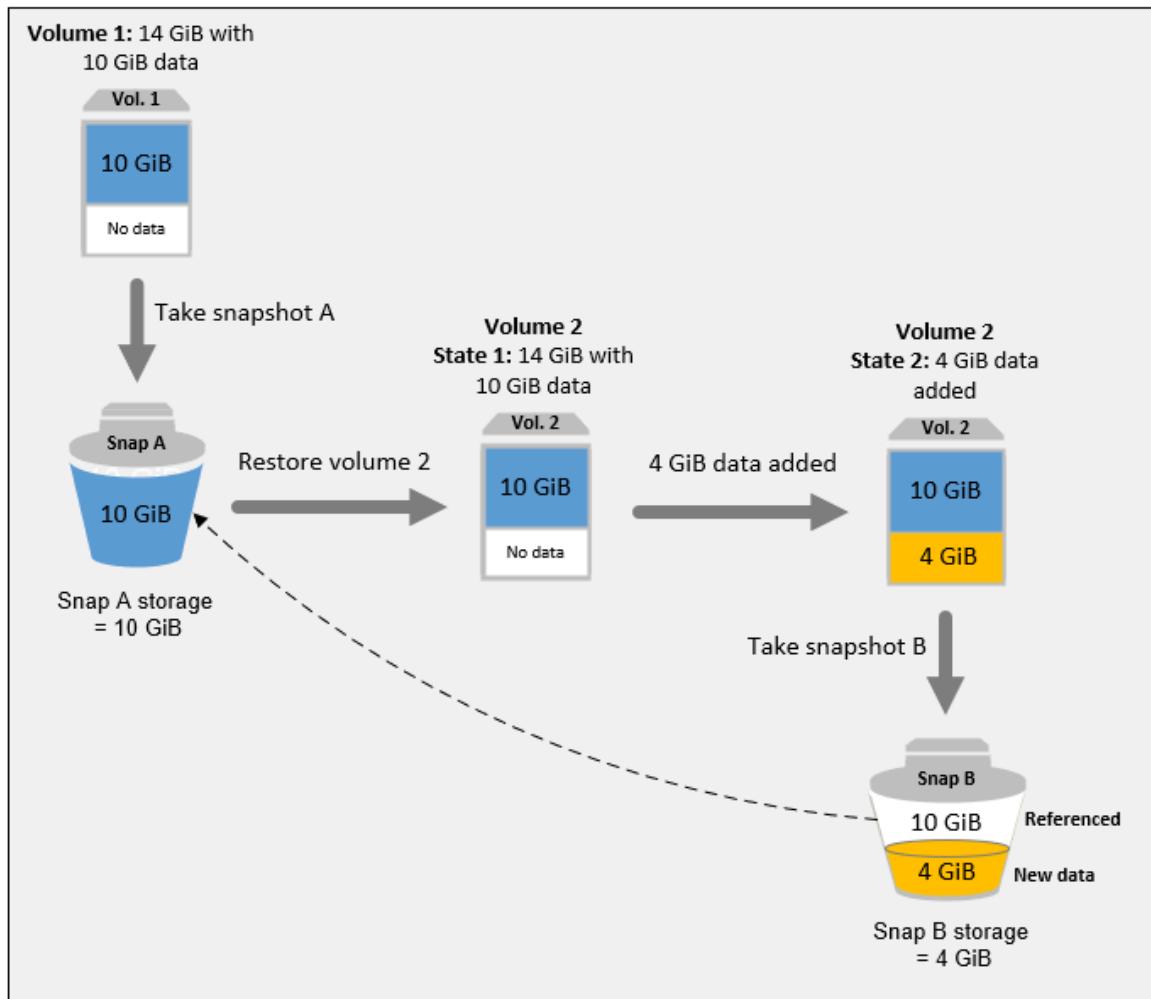

The diagram in this section shows how incremental snapshots can be taken from different volumes.

1. **Vol 1**, which is 14 GiB in size, has 10 GiB of data. Because **Snap A** is the first snapshot taken of the volume, it is a full snapshot and the entire 10 GiB of data is backed up.
 2. **Vol 2** is created from **Snap A**, so it is an exact replica of **Vol 1** at the time the snapshot was taken.
 3. Over time, 4 GiB of data is added to **Vol 2** and the total size of its data is 14 GiB.
 4. **Snap B** is taken from **Vol 2**. For **Snap B**, only the 4 GiB of data that was added after the volume was created from **Snap A** is backed up. The other 10 GiB of unchanged data, which is already stored in **Snap A**, is referenced by **Snap B** instead of being backed up again.

Snap B is an incremental snapshot of **Snap A**, even though it was created from a different volume.

Important

The diagram assumes that you own **Vol 1** and **Snap A**, and that **Vol 2** is encrypted with the same KMS key as Vol 1. If **Vol 1** was owned by another AWS account and that account took **Snap A** and shared it with you, then **Snap B** would be a full snapshot. Or, if **Vol 2** was encrypted with a different KMS key than **Vol 1**, then **Snap B** would be a full snapshot.

For more information about how data is managed when you delete a snapshot, see [Delete an Amazon EBS snapshot \(p. 1779\)](#).

Copy and share snapshots

You can share a snapshot across AWS accounts by modifying its access permissions. You can make copies of your own snapshots as well as snapshots that have been shared with you. For more information, see [Share an Amazon EBS snapshot \(p. 1810\)](#).

A snapshot is constrained to the AWS Region where it was created. After you create a snapshot of an EBS volume, you can use it to create new volumes in the same Region. For more information, see [Create a volume from a snapshot \(p. 1728\)](#). You can also copy snapshots across Regions, making it possible to use multiple Regions for geographical expansion, data center migration, and disaster recovery. You can copy any accessible snapshot that has a completed status. For more information, see [Copy an Amazon EBS snapshot \(p. 1781\)](#).

Encryption support for snapshots

EBS snapshots fully support EBS encryption.

- Snapshots of encrypted volumes are automatically encrypted.
- Volumes that you create from encrypted snapshots are automatically encrypted.
- Volumes that you create from an unencrypted snapshot that you own or have access to can be encrypted on-the-fly.
- When you copy an unencrypted snapshot that you own, you can encrypt it during the copy process.
- When you copy an encrypted snapshot that you own or have access to, you can reencrypt it with a different key during the copy process.
- The first snapshot you take of an encrypted volume that has been created from an unencrypted snapshot is always a full snapshot.
- The first snapshot you take of a reencrypted volume, which has a different CMK compared to the source snapshot, is always a full snapshot.

Complete documentation of possible snapshot encryption scenarios is provided in [Create Amazon EBS snapshots \(p. 1762\)](#) and in [Copy an Amazon EBS snapshot \(p. 1781\)](#).

For more information, see [Amazon EBS encryption \(p. 1921\)](#).

Create Amazon EBS snapshots

To create an application-consistent snapshot, see [Create a VSS application-consistent snapshot \(p. 1766\)](#).

You can create a point-in-time snapshot of an EBS volume and use it as a baseline for new volumes or for data backup. If you make periodic snapshots of a volume, the snapshots are incremental—the new snapshot saves only the blocks that have changed since your last snapshot.

Snapshots occur asynchronously; the point-in-time snapshot is created immediately, but the status of the snapshot is pending until the snapshot is complete (when all of the modified blocks have been transferred to Amazon S3), which can take several hours for large initial snapshots or subsequent snapshots where many blocks have changed. While it is completing, an in-progress snapshot is not affected by ongoing reads and writes to the volume.

You can take a snapshot of an attached volume that is in use. However, snapshots only capture data that has been written to your Amazon EBS volume at the time the snapshot command is issued. This might exclude any data that has been cached by any applications or the operating system. If you can pause any file writes to the volume long enough to take a snapshot, your snapshot should be complete. However, if you can't pause all file writes to the volume, you should unmount the volume from within the instance, issue the snapshot command, and then remount the volume to ensure a consistent and complete snapshot. You can remount and use your volume while the snapshot status is pending.

To make snapshot management easier, you can tag your snapshots during creation or add tags afterward. For example, you can apply tags describing the original volume from which the snapshot was created, or the device name that was used to attach the original volume to an instance. For more information, see [Tag your Amazon EC2 resources \(p. 2085\)](#).

Snapshot encryption

Snapshots that are taken from encrypted volumes are automatically encrypted. Volumes that are created from encrypted snapshots are also automatically encrypted. The data in your encrypted volumes and any associated snapshots is protected both at rest and in motion. For more information, see [Amazon EBS encryption \(p. 1921\)](#).

By default, only you can create volumes from snapshots that you own. However, you can share your unencrypted snapshots with specific AWS accounts, or you can share them with the entire AWS community by making them public. For more information, see [Share an Amazon EBS snapshot \(p. 1810\)](#).

You can share an encrypted snapshot only with specific AWS accounts. For others to use your shared, encrypted snapshot, you must also share the CMK key that was used to encrypt it. Users with access to your encrypted snapshot must create their own personal copy of it and then use that copy. Your copy of a shared, encrypted snapshot can also be re-encrypted using a different key. For more information, see [Share an Amazon EBS snapshot \(p. 1810\)](#).

Multi-volume snapshots

You can create multi-volume snapshots, which are point-in-time snapshots for all, or some, of the volumes attached to an instance.

By default, when you create multi-volume snapshots from an instance, Amazon EBS creates snapshots of all the volumes (root and data (non-root)) that are attached to the instance. However, you can choose to create snapshots of a subset of the volumes that are attached to the instance.

You can tag your multi-volume snapshots as you would a single volume snapshot. We recommend you tag your multiple volume snapshots to manage them collectively during restore, copy, or retention. You can also choose to automatically copy tags from the source volume to the corresponding snapshots. This helps you to set the snapshot metadata, such as access policies, attachment information, and cost allocation, to match the source volume.

After the snapshots are created, each snapshot is treated as an individual snapshot. You can perform all snapshot operations, such as restore, delete, and copy across Regions or accounts, just as you would with a single volume snapshot.

Multi-volume, crash-consistent snapshots are typically restored as a set. It is helpful to identify the snapshots that are in a crash-consistent set by tagging your set with the instance ID, name, or other relevant details.

After creating your snapshots, they appear in your EC2 console created at the exact point-in-time.

If any one snapshot for the multi-volume snapshot set fails, all of the other snapshots display an error status and a `createSnapshots` CloudWatch event with a result of `failed` is sent to your AWS account. For more information, see [Create snapshots \(createSnapshots\) \(p. 1990\)](#).

Amazon Data Lifecycle Manager

You can create snapshot lifecycle policies to automate the creation and retention of snapshots of individual volumes and multi-volume snapshots of instances. For more information, see [Amazon Data Lifecycle Manager \(p. 1859\)](#).

Considerations

The following considerations apply to creating snapshots:

- When you create a snapshot for an EBS volume that serves as a root device, we recommend that you stop the instance before taking the snapshot.
- You cannot create snapshots from instances for which hibernation is enabled, or from hibernated instances. If you create a snapshot or AMI from an instance that is hibernated or has hibernation enabled, you might not be able to connect to a new instance that is launched from the AMI, or from an AMI that was created from the snapshot.
- Although you can take a snapshot of a volume while a previous snapshot of that volume is in the pending status, having multiple pending snapshots of a volume can result in reduced volume performance until the snapshots complete.
- There is a limit of one pending snapshot for a single `st1` or `sc1` volume, or five pending snapshots for a single volume of the other volume types. If you receive a

ConcurrentSnapshotLimitExceeded error while trying to create multiple concurrent snapshots of the same volume, wait for one or more of the pending snapshots to complete before creating another snapshot of that volume.

- When a snapshot is created from a volume with an AWS Marketplace product code, the product code is propagated to the snapshot.
- When creating multi-volume snapshot sets from instances, you can specify up to 127 data (non-root) volumes to exclude. The maximum number of Amazon EBS volumes that you can attach to an instance depends on the instance type and instance size. For more information, see [Instance volume limits \(p. 2019\)](#).

Create a snapshot

To create a snapshot from the specified volume, use one of the following methods.

Console

To create a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**, **Create snapshot**.
3. For **Resource type**, choose **Volume**.
4. For **Volume ID**, select the volume from which to create the snapshot.

The **Encryption** field indicates the selected volume's encryption status. If the selected volume is encrypted, the snapshot is automatically encrypted using the same KMS key. If the selected volume is unencrypted, the snapshot is not encrypted.

5. (Optional) For **Description**, enter a brief description for the snapshot.
6. (Optional) To assign custom tags to the snapshot, in the **Tags** section, choose **Add tag**, and then enter the key-value pair. You can add up to 50 tags.
7. Choose **Create snapshot**.

AWS CLI

To create a snapshot using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 5\)](#).

- [create-snapshot](#) (AWS CLI)
- [New-EC2Snapshot](#) (AWS Tools for Windows PowerShell)

Create a multi-volume snapshot

When you create a multi-volume snapshot set from an instance, you can choose whether to copy the tags from the source volume to the corresponding snapshot. You can specify whether to create a snapshot of the root volume. You can also specify whether to create snapshots of all the data (non-root) volumes that are attached to the instance, or whether to create snapshots of a subset of those volumes.

Considerations

- Multi-volume snapshots support up to 128 Amazon EBS volumes for each instance, which includes the root volume and up to 127 data (non-root) volumes. The maximum number of Amazon EBS volumes that you can attach to an instance depends on the instance type and instance size. For more information, see [Instance volume limits \(p. 2019\)](#).

To create a snapshot from the volumes of an instance, use one of the following methods.

Console

To create multi-volume snapshots using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**, **Create snapshot**.
3. For **Resource type**, choose **Instance**.
4. For **Description**, enter a brief description for the snapshots. This description is applied to all of the snapshots.
5. (Optional) By default, Amazon EBS creates a snapshot of the instance's root volume. If you do not want to create a snapshot of the instance's root volume, select **Exclude root volume**.
6. (Optional) By default, Amazon EBS creates snapshots of all the data (non-root) volumes attached to the instance. If you want to create snapshots of a subset of the data (non-root) volumes attached to the instance, select **Exclude specific data volumes**. The **Attached data volumes** section lists all of the data volumes that are currently attached to the selected instance.

In the **Attached data volumes** section, select the data volumes for which you do **not** want to create snapshots. Only the volumes that remain unselected will be included in the multi-volume snapshot set. You can exclude up to 127 volumes.

7. (Optional) To automatically copy tags from the source volumes to the corresponding snapshots, for **Copy tags from source volume**, select **Copy tags**. This sets snapshot metadata—such as access policies, attachment information, and cost allocation—to match the source volume.
8. (Optional) To assign additional custom tags to the snapshots, in the **Tags** section, choose **Add tag**, and then enter the key-value pair. You can add up to 50 tags.
9. Choose **Create snapshot**.

During snapshot creation, the snapshots are managed together. If one of the snapshots in the volume set fails, the other snapshots are moved to error status for the volume set. You can monitor the progress of your snapshots using [CloudWatch Events](#). After the snapshot creation process completes, CloudWatch generates an event that contains the status and all of the relevant snapshot details for the affected instance.

Command line

AWS CLI

To create multi-volume snapshots using the AWS CLI, use the [create-snapshots](#) command.

If you do not want to create a snapshot of the root volume, for `--instance-specification ExcludeBootVolume`, specify `true`. If you do not want to create snapshots of all the data (non-root) volumes attached to the instance, for `--instance-specification ExcludeDataVolumes`, specify the IDs of the data volumes for which you do not want to create snapshots. You can specify up to 127 data (non-root) volumes to exclude.

AWS Tools for Windows PowerShell

To create multi-volume snapshots using the Tools for Windows PowerShell, use the [New-EC2SnapshotBatch](#) command.

If you do not want to create a snapshot of the root volume, for `-InstanceSpecification_ExcludeBootVolume`, specify `1`. If you do not want to create snapshots of all the data (non-root) volumes attached to the instance, for `-InstanceSpecification_ExcludeDataVolumes`, specify the IDs of the data volumes for which you do not want to create snapshots. You can specify up to 127 data (non-root) volumes to exclude.

To create application-consistent snapshots using Systems Manager Run Command

You can use Systems Manager Run Command to take application-consistent snapshots of all EBS volumes attached to your Amazon EC2 Windows instances. The snapshot process uses the Windows [Volume Shadow Copy Service \(VSS\)](#) to take image-level backups of VSS-aware applications, including data from pending transactions between these applications and the disk. You don't need to shut down your instances or disconnect them when you back up all attached volumes. For more information, see [Create a VSS application-consistent snapshot \(p. 1766\)](#).

If all of the snapshots complete successfully, a `createSnapshots` CloudWatch event with a result of `succeeded` is sent to your AWS account. If any one snapshot for the multi-volume snapshot set fails, all of the other snapshots display an error status and a `createSnapshots` CloudWatch event with a result of `failed` is sent to your AWS account. For more information, see [Create snapshots \(createSnapshots\) \(p. 1990\)](#).

Work with EBS snapshots

You can copy snapshots, share snapshots, and create volumes from snapshots. For more information, see the following:

- [Copy an Amazon EBS snapshot \(p. 1781\)](#)
- [Share an Amazon EBS snapshot \(p. 1810\)](#)
- [Create a volume from a snapshot \(p. 1728\)](#)

Create a VSS application-consistent snapshot

You can take application-consistent snapshots of all Amazon EBS volumes attached to your Windows on Amazon EC2 instances using [AWS Systems Manager Run Command](#). The snapshot process uses the Windows [Volume Shadow Copy Service \(VSS\)](#) to take image-level backups of VSS-aware applications. The snapshots include data from pending transactions between these applications and the disk. You don't have to shut down your instances or disconnect them when you need to back up all attached volumes.

There is no additional cost to use VSS-enabled EBS snapshots. You only pay for EBS snapshots created by the backup process. For more information, see [How is my EBS snapshot bill calculated?](#)

Contents

- [How it works \(p. 1766\)](#)
- [Before you begin \(p. 1767\)](#)
- [Get started \(p. 1768\)](#)
- [Create a VSS application-consistent snapshot \(p. 1772\)](#)
- [Restore volumes from VSS-enabled EBS snapshots \(p. 1778\)](#)
- [AWS VSS component package version history \(p. 1778\)](#)

How it works

The process for taking application-consistent, VSS-enabled EBS snapshots consists of the following steps.

1. Complete Systems Manager prerequisites.
2. Enter parameters for the `AWSEC2-CreateVssSnapshot` SSM document and run this document by using Run Command. You can't create a VSS-enabled EBS snapshot for a specific volume. You can, however, specify a parameter to exclude the boot volume from the backup process.
3. The VSS agent on your instance coordinates all ongoing I/O operations for running applications.

4. The system flushes all I/O buffers and temporarily pauses all I/O operations. The pause lasts, at most, ten seconds.
5. During the pause, the system creates snapshots of all volumes attached to the instance.
6. The pause is lifted and I/O resumes operation.
7. The system adds all newly-created snapshots to the list of EBS snapshots. The system tags all VSS-enabled EBS snapshots successfully created by this process with **AppConsistent:true**. This tag helps you identify snapshots created by this process, as opposed to other processes. If the system encounters an error, the snapshot created by this process does not include the **AppConsistent:true** tag.
8. If you need to restore from a snapshot, you can use the standard EBS process of creating a volume from a snapshot, or you can restore all volumes to an instance by using a sample script, which is described later in this section.

Before you begin

Before you create VSS-enabled EBS snapshots by using Run Command, review the following requirements and limitations, and complete the required tasks.

Important

The **AWSVssComponents** package and the AWSEC2-CreateVssSnapshot and AWSEC2-ManageVssIO SSM documents no longer receive updates for Windows Server 2008 R2.

The **AWSVssComponents** package supports Windows Server 2008 R2 up to version 1.3.1.0 and no later.

You can query the latest version of Windows 2008 R2 supported by the AWSEC2-CreateVssSnapshot and AWSEC2-ManageVssIO SSM documents by using the **GetDocument** API and specifying 2008R2 for **-VersionName**. For example:

```
Get-SSMDocument -Name AWSEC2-CreateVssSnapshot -VersionName "2008R2"
```

Amazon EC2 Windows instance requirements

VSS-enabled EBS snapshots are supported for instances running Windows Server 2012 or later. Verify that your instances meet all requirements for Amazon EC2 Windows. For more information, see [Setting Up AWS Systems Manager](#) in the *AWS Systems Manager User Guide*.

.NET Framework version

The AWSVssComponents package requires .NET Framework version 4.6 and later. If you are using Windows 2012, or 2012 R2, the default .NET Framework version is earlier than 4.6 and you must install version 4.6 or later using Windows Update.

SSM Agent version

Update your instances to use SSM Agent version 2.2.58.0 or later. If you are using an older version of SSM Agent, you can update it by using Run Command. For more information, see [Update SSM Agent by using Run Command](#) in the *AWS Systems Manager User Guide*.

AWS Tools for Windows PowerShell version

Ensure that your instance is running version 3.3.48.0 or later of the AWS Tools for Windows PowerShell. To check your version number, run the following command on the instance in a PowerShell console:

```
Get-AWSPowerShellVersion
```

If you need to update the version of Tools for Windows PowerShell on your instance, see [Setting up the AWS Tools for Windows PowerShell on a Windows-based Computer](#) in the *AWS Tools for Windows PowerShell User Guide*.

Windows Powershell version

Ensure that your instance is running Windows PowerShell major version 3, 4, or 5. To check your version number, run the following command on the instance in a Windows PowerShell console:

```
$PSVersionTable.PSVersion
```

PowerShell language mode

Ensure that your instance has the PowerShell language mode set to FullLanguage. For more information about language modes, see [about_Language_Modes](#) in the Microsoft documentation.

Get started

These instructions describe how to install the VSS components and perform an application-consistent snapshot of the EBS volumes attached to an EC2 Windows instance. For more information, see [Getting Started with Amazon EC2 Windows Instances](#).

Contents

- [Create an IAM role for VSS-enabled snapshots \(p. 1768\)](#)
- [Download and install VSS components to the Windows on EC2 instance \(p. 1769\)](#)
- [Create a VSS application-consistent snapshot using the console \(p. 1771\)](#)

Create an IAM role for VSS-enabled snapshots

The following procedures describes how to work with IAM policies and IAM roles. The policy enables Systems Manager to create snapshots, tags snapshots, and attach metadata like a device ID to the default snapshot tags that the system creates.

To create an IAM policy for VSS-enabled snapshots

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Policies**, and then choose **Create policy**.
3. On the **Create policy** page, choose the **JSON** tab, and then replace the default content with the following JSON policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": [  
                "arn:aws:ec2:*::snapshot/*",  
                "arn:aws:ec2:*::image/*"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:CreateSnapshot",  
                "ec2:CreateImage",  
                "ec2:DescribeImages",  
                "ec2:DescribeSnapshots"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

If you do not intend to set the **CreateAmi** parameter to **True**, then you can omit `arn:aws:ec2:*::image/*` from the first policy statement and you can omit `ec2:CreateImage`, `ec2:DescribeSnapshots`, and `ec2:DescribeImages` from the second policy statement.

If you intend to always set the **CreateAmi** parameter to **True**, then you can omit `ec2:CreateSnapshot` from the second policy statement.

4. Choose **Review policy**.
5. For **Name**, enter a name to identify the policy, such as **VssSnapshotRole** or another name that you prefer.
6. (Optional) For **Description**, enter a description of the role's purpose.
7. Choose **Create policy**.

Use the following procedure to create an IAM role for VSS-enabled snapshots. This role includes policies for Amazon EC2 and Systems Manager.

To create an IAM role for VSS-enabled EBS snapshots

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**, and then choose **Create role**.
3. Under **Select type of trusted entity**, choose **AWS Service**.
4. Immediately under **Choose the service that will use this role**, choose **EC2**, and then choose **Next: Permissions**.
5. Under **Select your use case**, choose **EC2**, and then choose **Next: Permissions**.
6. In the list of policies, choose the box next to **AmazonSSMManagedInstanceCore**. (Type **SSM** in the search box if you need to narrow the list.)
7. Choose **Next: Tags**.
8. (Optional) Add one or more tag key-value pairs to organize, track, or control access for this role, and then choose **Next: Review**.
9. For **Role name**, enter a name for the role, such as **VssSnapshotRole** or another name that you prefer.
10. (Optional) For **Role description**, replace the default text with a description of this role's purpose.
11. Choose **Create role**. The system returns you to the **Roles** page.
12. Choose the role that you just created. The role **Summary page** opens.
13. Choose **Attach policies**.
14. Search for and choose the box next to the policy you created in the previous procedure, such as **VssSnapshotRole** or another name that you chose.
15. Choose **Attach policy**.
16. Attach this role to the instances for which you want to create VSS-enabled EBS snapshots. For more information, see [Attach an IAM role to an instance \(p. 1656\)](#).

Download and install VSS components to the Windows on EC2 instance

Systems Manager requires VSS components to be installed on your instances. Use the following procedure to install the components using the `AWSVssComponents` package. The package installs two components: a VSS requester and a VSS provider. We recommend that you install the latest AWS VSS component package to improve reliability and performance of application-consistent snapshots on your EC2 Windows instances. To view the latest package version, see the [AWS VSS component package version history \(p. 1778\)](#).

1. Open the AWS Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.

2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. For **Command document**, choose the button next to **AWS-ConfigureAWSPackage**.
5. For **Command parameters**, do the following:
 - a. Verify that **Action** is set to **Install**.
 - b. For **Name**, enter **AwsVssComponents**.
 - c. For **Version**, leave the field empty so that Systems Manager installs the latest version.
6. For **Targets**, identify the instances on which you want to run this operation by specifying tags or selecting instances manually.

Note

If you choose to select instances manually, and an instance you expect to see is not included in the list, see [Where Are My Instances?](#) in the *AWS Systems Manager User Guide* for troubleshooting tips.

7. For **Other parameters**:
 - (Optional) For **Comment**, type information about this command.
 - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.
8. (Optional) For **Rate control**:
 - For **Concurrency**, specify either a number or a percentage of instances on which to run the command at the same time.

Note

If you selected targets by choosing Amazon EC2 tags, and you are not certain how many instances use the selected tags, then limit the number of instances that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other instances after it fails on either a number or a percentage of instances. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Instances still processing the command might also send errors.
9. (Optional) For **Output options** section, if you want to save the command output to a file, select the box next to **Enable writing to an S3 bucket**. Specify the bucket and (optional) prefix (folder) names.

Note

The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile assigned to the instance, not those of the user performing this task.

For more information, see [Create an IAM Instance Profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

10. (Optional) Specify options for **SNS notifications**.

For information about configuring Amazon SNS notifications for Run Command, see [Configuring Amazon SNS Notifications for AWS Systems Manager](#).

11. Choose **Run**.

Verify the signature on AWS VSS components

Use the following procedure to verify the signature on the AWSVssComponents package.

1. Connect to your Windows instance. For more information, see [Connect to your Windows instance \(p. 626\)](#).
2. Navigate to C:\Program Files\Amazon\AwsVssComponents.
3. Open the context (right-click) menu for ec2-vss-agent.exe, and then choose **Properties**.

4. Navigate to the **Digital Signatures** tab and verify that the name of the signer is Amazon Web Services Inc.
5. Use the preceding steps to verify the signature on Ec2VssInstaller and Ec2VssProvider.dll.

Create a VSS application-consistent snapshot using the console

Use the following procedure to create a VSS-enabled EBS snapshot.

To create VSS-enabled EBS snapshots using the console

1. Open the AWS Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. For **Command document**, choose AWSEC2-CreateVssSnapshot for the **Document name**, then choose **Default version** at **runtime** as the **Document version**.
5. For **Targets**, identify the instances on which you want to run this operation by specifying tags or selecting instances manually.

Note

If you choose to select instances manually, and an instance you expect to see is not included in the list, see [Where Are My Instances?](#) for troubleshooting tips.

6. For **Command parameters**, do the following:
 - a. Choose an option from the **Exclude Boot Volume** list. Use this parameter to exclude boot volumes from the backup process.
 - b. (Optional) For **Description** field, type a description. This description is applied to any snapshot created by this process.
 - c. (Optional) For **Tags**, type keys and values for tags that you want to apply to any snapshot created by this process. Tags can help you locate, manage, and restore volumes from a list of snapshots. By default, the system populates the tag parameter with a Name key. For the value of this key, specify a name that you want to apply to snapshots created by this process. If you want to specify additional tags, separate tags by using a semicolon. For example, Key=*Environment*, Value=*Test*;Key=*User*, Value=*TestUser1*.

We recommend that you tag snapshots. By default, the system tags snapshots with the device ID, and AppConsistent (for indicating successful, application-consistent VSS-enabled EBS snapshots).

- d. For **Copy Only**, choose **True** to perform a Copy-only backup operation. This option is set to **False** by default so that AWS VSS performs a Full backup operation. If you are using the native SQL Server backup in addition to AWS VSS, setting the **Copy Only** option to **True** prevents AWS VSS from breaking the native differential backup chain.

Note

This option requires that AWS VSS provider version 1.2.00 or later be installed.

- e. For **No Writers**, choose **True** to exclude application VSS writers from the snapshot process. This can help you resolve conflicts with third-party VSS backup components. This option is set to **False** by default.

Note

This option requires that AWS VSS provider version 1.2.00 or later be installed.

- f. For **CreateAmi**, choose **True** to create an Amazon Machine Image (AMI) backup that is VSS-enabled, instead of an EBS snapshot. This option is set to **False** by default. For more information about creating an AMI, see [Create a Windows AMI from a running instance](#).
- g. (Optional) For **AmiName**, specify a name for the created AMI. This option applies only if the **CreateAmi** option is set to **True**.

7. For **Other parameters**:

- For **Comment**, type information about this command.
- For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. (Optional) For **Rate control**:

- For **Concurrency**, specify either a number or a percentage of instances on which to run the command at the same time.

Note

If you selected targets by choosing Amazon EC2 tags, and you are not certain how many instances use the selected tags, then limit the number of instances that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other instances after it fails on either a number or a percentage of instances. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Instances still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the box next to **Enable writing to an S3 bucket**. Specify the bucket and (optional) prefix (folder) names.

Note

The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile assigned to the instance, not those of the user performing this task. For more information, see [Setting Up Systems Manager](#).

10. (Optional) Specify options for **SNS notifications**.

For information about configuring Amazon SNS notifications for Run Command, see [Configuring Amazon SNS Notifications for AWS Systems Manager](#) in the *AWS Systems Manager User Guide*.

11. Choose **Run**.

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the Systems Manager command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

If the command failed and you are using Systems Manager with VPC endpoints, verify that you configured the `com.amazonaws.region.ec2` endpoint. Without the EC2 endpoint defined, the call to enumerate attached EBS volumes fails, which causes the Systems Manager command to fail. For more information about setting up VPC endpoints with Systems Manager, see [Create a Virtual Private Cloud Endpoint](#) in the *AWS Systems Manager User Guide*.

Note

You can automate backups by creating a maintenance window task that uses the AWSEC2-CreateVssSnapshot SSM document. For more information, see [Working with Maintenance Windows \(Console\)](#).

Create a VSS application-consistent snapshot

This section includes procedures for creating VSS-enabled EBS snapshots by using the AWS CLI or AWS Tools for Windows PowerShell. It also contains an advanced method for creating VSS-enabled snapshots using the AWSEC2-ManageVssIO SSM document.

Contents

- [Before you begin \(p. 1773\)](#)
- [Install the VSS package \(p. 1773\)](#)

- [Create VSS-enabled EBS snapshots \(p. 1774\)](#)
- [Troubleshoot VSS-enabled EBS snapshots \(p. 1777\)](#)

Before you begin

If you intend to use the AWS CLI, ensure that you have the latest version of the AWS CLI installed. For more information, see [Installing or upgrading and then configuring the AWS CLI](#) in the *AWS Systems Manager User Guide*.

If you intend to use the AWS Tools for Windows PowerShell, ensure that you have the latest version of the Tools for Windows PowerShell installed. For more information, see [Installing or upgrading and then configuring the AWS Tools for Windows PowerShell](#) in the *AWS Systems Manager User Guide*.

Tip

You can also use [AWS CloudShell](#) for a browser-based, pre-authenticated shell launched directly from the AWS Management Console.

Install the VSS package

Use one of the following command-line procedures to download and install the VSS components to the Windows on EC2 instance.

Topics

- [Install the VSS package using the AWS CLI \(p. 1773\)](#)
- [Install the VSS package using the Tools for Windows PowerShell \(p. 1773\)](#)

Install the VSS package using the AWS CLI

Use the following procedure to download and install the AwsVssComponents package on your instances by using Run Command from the AWS CLI. The package installs two components: a VSS requestor and a VSS provider. The system copies these components to a directory on the instance, and then registers the provider DLL as a VSS provider.

To install the VSS package by using the AWS CLI

- Run the following command to download and install the required VSS components for Systems Manager.

```
aws ssm send-command \
--document-name "AWS-ConfigureAWSPackage" \
--instance-ids "i-12345678" \
--parameters '{"action":["Install"],"name":["AwsVssComponents"]}'
```

Install the VSS package using the Tools for Windows PowerShell

Use the following procedure to download and install the AwsVssComponents package on your instances by using Run Command from the Tools for Windows PowerShell. The package installs two components: a VSS requestor and a VSS provider. The system copies these components to a directory on the instance, and then registers the provider DLL as a VSS provider.

To install the VSS package using the AWS Tools for Windows PowerShell

1. Open AWS Tools for Windows PowerShell and run the following command to specify your user access keys. Your user must either have administrative access for Amazon EC2 or it must have the required permissions granted. For more information, see [Setting Up AWS Systems Manager](#) in the *AWS Systems Manager User Guide*.

```
Set-AWSCredentials -AccessKey key_name -SecretKey key_name
```

2. Run the following command to set the Region for your PowerShell session. The example uses the us-east-2 Region.

```
Set-DefaultAWSRegion -Region us-east-2
```

3. Run the following command to download and install the required VSS components for Systems Manager.

```
Send-SSMCommand -DocumentName AWS-ConfigureAWSPackage -InstanceId "$instance" -  
Parameter @{'action'='Install';'name'='AwsVssComponents'}
```

Create VSS-enabled EBS snapshots

Use one of the following command-line procedures to create VSS-enabled EBS snapshots.

Topics

- [Create VSS-enabled EBS snapshots using the AWS CLI \(p. 1774\)](#)
- [Create VSS-enabled EBS snapshots using AWS Tools for Windows PowerShell \(p. 1775\)](#)
- [Create VSS-enabled EBS snapshots using the AWSEC2-ManageVssIO SSM document \(advanced\) \(p. 1776\)](#)

Create VSS-enabled EBS snapshots using the AWS CLI

Use the following procedure to create VSS-enabled EBS snapshots by using the AWS CLI. When you run the command, you can specify the following parameters:

- Instance (Required): Specify one or more Amazon EC2 Windows instances. You can either manually specify instances, or you can specify tags.
- Description (Optional): Specify details about this backup.
- Tags (Optional): Specify key-value tag pairs that you want to assign to the snapshots. Tags can help you locate, manage, and restore volumes from a list of snapshots. By default, the system populates the tag parameter with a Name key. For the value of this key, specify a name that you want to apply to snapshots created by this process. You can also add custom tags to this list by using the following format: Key=*Environment*, Value=*Test*;Key=*User*, Value=*TestUser1*.

This parameter is optional, but we recommend that you tag snapshots. By default, the system tags snapshots with the device ID, and AppConsistent (for indicating successful, application-consistent VSS-enabled EBS snapshots).

- Exclude Boot Volume (Optional): Use this parameter to exclude boot volumes from the backup process.

To create VSS-enabled EBS snapshots by using the AWS CLI

- Run the following command to create VSS-enabled EBS snapshots.

```
aws ssm send-command \  
  --document-name "AWSEC2-CreateVssSnapshot" \  
  --instance-ids "i-12345678" \  
  --parameters '{"ExcludeBootVolume":["False"],"description":["Description"],"tags":  
  ["Key=key_name,Value=tag_value"]}'
```

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed.

You can automate backups by creating a maintenance window task that uses the AWSEC2-CreateVssSnapshot SSM document. For more information, see [Working with Maintenance Windows \(Console\)](#) in the *AWS Systems Manager User Guide*.

Create VSS-enabled EBS snapshots using AWS Tools for Windows PowerShell

Use the following procedure to create VSS-enabled EBS snapshots by using the AWS Tools for Windows PowerShell. When you run the command, you can specify the following parameters:

- Instance (Required): Specify one or more Amazon EC2 Windows instances. You can either manually specify instances, or you can specify tags.
- Description (Optional): Specify details about this backup.
- Tags (Optional): Specify key-value tag pairs that you want to assign to the snapshots. Tags can help you locate, manage, and restore volumes from a list of snapshots. By default, the system populates the tag parameter with a Name key. For the value of this key, specify a name that you want to apply to snapshots created by this process. You can also add custom tags to this list by using the following format: Key=*Environment*, Value=*Test*;Key=*User*, Value=*TestUser1*.

This parameter is optional, but we recommend that you tag snapshots. By default, the system tags snapshots with the device ID, and AppConsistent (for indicating successful, application-consistent VSS-enabled EBS snapshots).

- Exclude Boot Volume (Optional): Use this parameter to exclude boot volumes from the backup process.

To create VSS-enabled EBS snapshots by using AWS Tools for Windows PowerShell

1. Open AWS Tools for Windows PowerShell and run the following command to specify your user access keys. Your user must either have administrative access for Amazon EC2 or it must have the required permissions granted. For more information, see [Setting Up AWS Systems Manager](#) in the *AWS Systems Manager User Guide*.

```
Set-AWSCredentials -AccessKey key_name -SecretKey key_name
```

2. Execute the following command to set the Region for your PowerShell session. The example uses the us-east-2 Region.

```
Set-DefaultAWSRegion -Region us-east-2
```

3. Execute the following command to create VSS-enabled EBS snapshots.

```
Send-SSMCommand -DocumentName AWSEC2-CreateVssSnapshot -InstanceId "$instance" -Parameter @{'ExcludeBootVolume'='False'; 'description'='a_description'; 'tags'='Key=key_name,Value=tag_value'}
```

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS snapshots.

You can automate backups by creating a maintenance window task that uses the AWSEC2-CreateVssSnapshot SSM document. For more information, see [Working with Maintenance Windows \(Console\)](#) in the *AWS Systems Manager User Guide*.

Create VSS-enabled EBS snapshots using the AWSEC2-ManageVssIO SSM document (advanced)

You can use the following script and the pre-defined AWSEC2-ManageVssIO SSM document to temporarily pause I/O, create VSS-enabled EBS snapshots, and restart I/O. This process runs in the context of the user who runs the command. If the user has sufficient permission to create and tag snapshots, then AWS Systems Manager can create and tag VSS-enabled EBS snapshots without the need for the additional IAM snapshot role on the instance.

In contrast, the AWSEC2-CreateVssSnapshot document requires that you assign the IAM snapshot role to each instance for which you want to create EBS snapshots. If you don't want to provide additional IAM permissions to your instances for policy or compliance reasons, then you can use the following script.

Before you begin

Note the following important details about this process:

- This process uses a PowerShell script (`CreateVssSnapshotAdvancedScript.ps1`) to take snapshots of all volumes on the instances you specify, except root volumes. If you need to take snapshots of root volumes, then you must use the AWSEC2-CreateVssSnapshot SSM document.
- The script calls the AWSEC2-ManageVssIO document twice. The first time with the Action parameter set to `Freeze`, which pauses all I/O on the instances. The second time, the Action parameter is set to `Thaw`, which forces I/O to resume.
- Don't attempt to use the AWSEC2-ManageVssIO document without using the `CreateVssSnapshotAdvancedScript.ps1` script. A limitation in VSS requires that the `Freeze` and `Thaw` actions be called no more than ten seconds apart, and manually calling these actions without the script could result in errors.

To create VSS-enabled EBS snapshots by using the AWSEC2-ManageVssIO SSM document

1. Open AWS Tools for Windows PowerShell and run the following command to specify your user access keys. Your user must either have administrative access for Amazon EC2 or it must have the required permissions granted. For more information, see [Setting Up AWS Systems Manager](#) in the *AWS Systems Manager User Guide*.

```
